1 Introduction and functional overview

This specification describes the functionality and the configuration of the AUTOSAR Basic Software module Dlt.

It receives log information from DET, DEM, SW-Cs, or trace information of the RTE. The DIt module transmits this data via communication busses to make this information visible outside the ECU.

For this purpose, the Dlt module defines the API to send and receive dedicated log/trace information on the bus.

In addition, the NvM module can be optionally used to store an updated filter setting of the Dlt module persistently. This enables the ECU to transmit log/trace information with the desired level without the need of an explicit setup request coming from the communication bus (via a logging tool) at every ECU startup.

The Dlt module is located on top of the PduR and below the RTE as shown in 1.1.

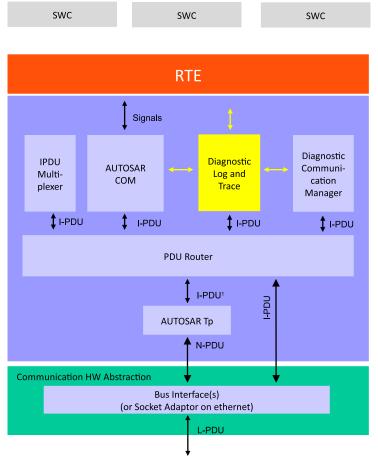

Figure 1.1: Location of the Dlt module

Please note: The Dlt Message Format, available Commands, and Protocol (to communicate with an external logging and tracing tool) are defined in [1].

2 Acronyms and Abbreviations

The glossary below includes acronyms, abbreviations and definitions relevant to the Diagnostic Log and Trace module that are not included in [2] or in [3].

Abbreviation / Acronym	Description
APID	Application ID
CTID	Context ID
Dit	Diagnostic Log and Trace
MCNT	Message Counter
MSBF	Most Significant Byte First
MSBI	Message Bus Info
MSCI	Message Control Info
MSLI	Message Log Info
MSTP	Message Type
MSTI	Message Trace Info
NOAR	Number of Arguments
STMS	Timestamp
UEH	Use Extended Header
VERB	Verbose
VERS	Version Number
WEID	With ECU ID
WSID	With Session ID
WTMS	With Timestamp

2.1 Term and definition

Description:
A log and trace message contains all data and options to describe a log and trace event in a software. The log and trace message consists of a header and payload.
A Dlt User represents the source of a generated Dlt message. The possible users are SW-Cs, RTE (for VFB traces), DEM, or DET.
A Log Message contains debug information like state changes or value changes.
A Trace messages contains information, which has passed via the VFB.
ECU ID is the name of an ECU, composed by four 8-bit ASCII characters (e.g., ABS0 or COMB).

\triangle

Term	Description:
Session	A session is a logical entity of source of log or trace messages. If an application / SW-C is instantiated several times, each instance gets a globally unique session ID with respect to the application / context ID. It is possible for an application / SWC to have several simultaneous log or trace sessions, if it has several ports opened to DIt.
	Since Session ID is not specified in AUTOSAR for SW-Cs, the port defined argument values shall be used for this number.
Session ID	Session ID is the identification number of a log or trace session.
Application ID	Application ID is an abbreviation of an application / SW-C. It identifies the application / SW-C a log and trace message originates from.
	The Application ID is composed by four 8-bit ASCII characters.
Context ID	Context ID is a user defined identifier to group Log and Trace Messages generated by an application / SW-C. The following rules apply:
	• Each ApplicationID can own several Context IDs.
	 Context IDs are grouped by Application IDs.
	 Context IDs shall be unique within an Application ID.
	 The source of a log and trace message is identified using the tuple "ApplicationID" and "ContextId".
	Four 8-bit ASCII characters compose the ContextId.
Message ID	Messaged ID is the ID to characterize the information, which is transported by the message itself. A Message ID identifies a kind of log or trace message uniquely. It can be used for identifying the source (in source code) of a message and it can be used for characterizing the payload of a message. A Message ID is statically fixed at development or configuration time.
Log and trace level	A log level defines a classification for the severity grade of a Log Message.
Trace status	The trace status provides information, if a trace message should be sent.
Log Channel	A physical Communication bus which is used to transmit Dlt messages.
External client	An external client is a tool to control, monitor, and store log / trace messages provided by ECUs using the Dlt module.

3.2 Related standards and norms

[4, ISO-7498-1]

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software [5] which is also valid for Dlt.

4 Constraints and assumptions

4.1 Limitations

VFB Trace only supports the non-verbose mode. I.e., the Dlt module will send out the arguments in a raw format, simply doing a memory copy of the arguments to the trace message.

The Dlt data type model does NOT support arbitrarily nested complex data types, which AUTOSAR does. So there is no generic way to transform arguments given to the VFB Trace hook functions into Dlt data types needed for the verbose mode.

An ASAM Fibex description cannot be generated by the Dlt module as the in-memory representation might not be compliant to the SWCD data type description of the arguments.

4.2 Applicability to car domains

This basic software module can be used for all car domains.

5 Dependencies to other modules

5.1 RTE

The RTE [6] (including the VFB and the BSW Scheduler) is used to interact with SW-Cs to generate Log and Trace messages and to call the Dlt module's Tx function cyclically.

5.2 PDU Router

In order to transmit Dlt messages on the communication bus, the Dlt module interacts with the PDU Router[7].

5.3 NvM

In order to load and store altered configurations like filter settings and/or Log Channel assignments, the NvM module[8] can optionally be used.

5.4 **GPT**

In order to derive a time stamp, the GPT module[9] can be used for this purpose.

5.5 StbM

In order to get a synchronized time value (Local Time Base derived from Global Time Base) in standard/extended format., the StbM module[10] can be used for this purpose.

5.6 **DET**

In order to be able to report default errors and to forward DET errors to the communication bus, the Dlt module has to interact with the DET module[11]. However, the interaction with DET is optional.

5.7 **DEM**

In order to be able to report development errors and to transmit DEM events on the communication bus, the Dlt module has to interact with the DEM module[12] using a CDD and/or a SW-C. No standardized interaction between DEM and DLT is available.

6 Requirements Tracing

The following tables reference requirements specified in an upper tracing level context and links to the fulfillment of these. Please note that if column "Satisfied by" is empty for a specific requirement, this means that this requirement is not fulfilled by this document.

Table 6.1: Requirements Tracing

7 Functional specification

7.1 Dlt specification

The following chapters describe the AUTOSAR specific data and control paths the Dlt module needs for the interaction with SW-Cs, PduR, and an external client (logging tool).

7.1.1 Dlt commands

The Dlt Protocol specifies all sorts of Dlt Commands which are identified by unique Service IDs. The Dlt Commands are used to modify the behavior of the Dlt module at runtime, e.g., fetching information about the current Dlt configuration or altering filter settings.

[SWS_DIt_00643] Supported Service ID to DIt Command Name mapping

Upstream requirements: RS_LT_00032

Γ

Service ID	Dit Command Name	Description
0x01	SetLogLevel	Set the Log Level
0x02	SetTraceStatus	Enable/Disable Trace Messages
0x03	GetLogInfo	Return the LogLevel for registered SW-Cs
0x04	GetDefaultLogLevel	Return the Log Level for wildcards
0x05	StoreConfiguration	Store the current configuration non-volatile
0x06	ResetToFactoryDefault	Set the configuration back to default
0x0A	SetMessageFiltering	Enable/Disable the Dlt filters
0x11	SetDefaultLogLevel	Set the LogLevel for wildcards
0x12	SetDefaultTraceStatus	Enable/Disable Trace Messages for wildcards
0x15	GetDefaultTraceStatus	Get the current TraceLevel for wildcards
0x17	GetLogChannelNames	Return the name(s) of the Log Channel(s)
0x1F	GetTraceStatus	Get the current trace status (on/off)
0x20	SetLogChannelAssignment	Add/ Remove the given LogChannel as output path
0x21	SetLogChannelThreshold	Set the filter threshold for the given Log Channel
0x22	GetLogChannelThreshold	Get the filter threshold for the given LogChannel
0x23	BufferOverflowNotification	Indication of a buffer overflow within the DLT module
0x24	SyncTimeStamp	Reports synchronized absolute time
0x13	GetSoftwareVersion	Get the ECU software version

18 of 147

1

Note: The layouts of the defined Dlt Commands, which can be received via Dlt Control Messages, are defined in [1].

7.1.2 DIt interaction with software components

The Dlt module offers interfaces SW-Cs can use for sending Log and Trace Messages as shown in 7.1.

Optionally, SW-Cs can provide a port for notifications on log level threshold and trace status changes, which are provided by the Dlt module separately for every tuple of <code>DltSwcApplicationId/DltSwcContextId</code>. These notifications can be used to avoid already the generation of Log and Trace Messages by the SW-Cs, instead of having them to be filtered out later on by the Dlt module.

Since the Dlt module supports multiple instances of SW-Cs, which use the same tuples of DltSwcApplicationId/DltSwcContextId, an additional DltSwcSessionId) parameter allows distinguishing log/trace messages from different instances of the same SW-C.

To separate those SW-Cs technically from each other and to avoid that SW-Cs have to use unique <code>DltSwcSessionId</code>)s in calls to <code>SendLogMessage/SendTraceMessage</code> (details, see next chapters), the Dlt module provides a dedicated <code>PPortPrototype</code> per configured SW-C (see configuration parameter <code>DltSwcSessionId</code>) where the SessionId is managed as a port-defined-argument.

If a configured SW-C is marked as being interested in notifications on log level and trace state changes, the DIt module also provides a corresponding RPortPrototype to notify the respective SW-C.

The information, which SW-C is responsible for which <code>DltSwcApplicationId/DltSwcContextId</code> tuples, is configured for the SW-C and/or updated by the SW-C during runtime with a call to <code>Dlt_RegisterContext</code> and <code>Dlt_UnregisterContext</code> respectively.

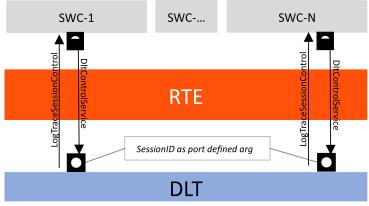

Figure 7.1: Interaction with SW-C (Port configuration)

[SWS_DIt_00644] [The Dlt module shall provide a PPortPrototype, SwcMessage-Service, typed by interface DltSwcMessageService for each configured SW-C (see DltSwc).]

[SWS_DIt_00645] [The PPortPrototype SwcMessageService typed by interface DltSwcMessageService has Dlt_SessionIDType as a port-defined argument.]

[SWS_Dlt_00646] [The Dlt module shall provide an RPortPrototype, Session-ControlCallback, typed by interface LogTraceSessionControl, for each configured SW-C (see configuration container DltSwc), where the configuration parameter DltSwcSupportLogLevelAndTraceStatusChangeNotification is set to TRUE.]

[SWS_DIt_00647] [The DltSwcApplicationId/DltSwcContextId tuples for which the SW-C is responsible for and therefore needs to be notified in case of log level or trace state changes shall be deduced from configuration parameter DltSwc-Context.]

7.1.2.1 Registering ApplicationIDs and ContextIds to DIt

The DIt module is able to inform SW-Cs about a log level change. For this purpose, they have to register at the DIt module, using a tuple of DltSwcApplicationId/DltSwcContextId at runtime.

Note:Because the development of SWCs are part of this specification, the Dlt module has to collect this information at runtime.

[SWS_DIt_00765] [The DIt module shall remember all tuples of DltSwcApplicationIds and DltSwcContextIds of the SW-Cs, which register to the DIt module.]

[SWS_DIt_00766] [The Dlt module shall manage a log level and a trace state for every tuple of DltSwcApplicationId and DltSwcContextId.]

Note: In addition, a dynamic registration supports the possibility for the Dlt module to see which SW-C/runnable is active and which not. This is essential to know which SW-C to inform in case of a log level or trace status change.

When a SW-C is calling the Dlt_RegisterContext method of the DltSwcMes-sageService interface, a port defined argument value is provided sessionId to the Dlt module.

The value of this port defined argument corresponds to LogTraceSessionControl interface of the SW-C/runnable for providing information about the changing of a log level to the SW-C/runnable.

[SWS_DIt_00021]

Upstream requirements: RS_LT_00033

[The DIt module shall remember the relation between the registered tuple of DltSwcApplicationId/DltSwcContextId, and the port interface where this tuple is registered.]

[SWS_DIt_00768] [If the parameter DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_RegisterContext is called, the Dlt module shall send the Dlt Control Message Dlt_GetLogInfo containing the provided DltSwcApplicationId/DltSwcContextId.]

7.1.2.2 Unregistering ApplicationIDs and ContextIds to Dlt

In case a SW-C is going to be stopped, it should unregister itself. This information can be used to inform an external client (e.g. a logging device) about the current SW-C status.

[SWS_DIt_00773] [The DIt module shall delete all tuples of DltSwcApplicationIds and DltSwcContextIds of the SW-Cs which unregister to the DIt module from the list of registered applications.]

Note: For these tuples, the Dlt module will not try to notify the corresponding SWC any more about LogLevel changes.

[SWS_DIt_00774] [If the parameter DltGeneralRegisterContextNotification is set to TRUE, every time Dlt_UnregisterContext is called, the Dlt module shall send the Dlt Control Message Dlt_GetLogInfo containing the provided DltSwcApplicationId/DltSwcContextId with parameter status set to 5.]

7.1.2.3 Using port defined argument values for the definition of SessionIds

For every function call of Dlt_SendLogMessage, Dlt_SendTraceMessage, Dlt_-RegisterContext and Dlt_UnregisterContext, a port defined argument value needs to be provided.

[SWS_DIt_00022] [Port defined argument values shall be used by the Dlt module as SessionIds.]

Note: A session is the part of a SW-C for which a log level monitor is responsible. For each log level monitor the same SessionId (port defined argument value) shall be used.

[SWS_DIt_00023] [The port defined argument value corresponds to the defined SessionID. The value shall start at 0×1000 (for BSW modules the module ID is taken).

[SWS_DIt_00332] [Each port of a SW-C connected to the DIt module shall have a unique SessionId as port defined argument. The range of SessionIds shall be continuous.]

7.1.3 VFB trace

The VFB trace is specified in the RTE. The meaning of VFB trace is an implicit (system inherent) forwarding of SW-C communication data (which flows over the RTE) to the Dlt module. Trace means in this case that no explicit call by the SW-C is made to forward this data to Dlt. This section describes the interaction of the RTE with the Dlt module to record a VFB trace and the internal control of the trace data.

7.1.3.1 Interfaces provided by Dlt for VFB traces

In case the DIt module is used as a VFB trace client, the RTE has to be configured accordingly. This means that the RTE configuration parameter RteVfbTraceClientPrefix has to be configured with value "Dlt".

The configuration, whether VFB tracing is enabled at all and which traceable events are supported/activated, is solely configured in the RTE module.

From its configuration, the RTE generator then updates in Generation Phase the RTEs Basic Software Module Description with BswModuleEntries for each configured VFB trace hook function. Those BswModuleEntries exactly describe the expected function prototype the configured trace clients have to provide:

- The expected function name is defined by the shortName.
- The rest of the expected signature is defined by the contained arguments.

The DIt module has to provide the implementation for all BswModuleEntries, which are referenced by the attribute outgoingCallback of the BswModuleDescription of the RTE, whose shortName starts with "Rte_Dlt".

[SWS_DIt_00284]

Upstream requirements: RS_LT_00008

[The DIt module shall be compliant to the VFB trace described in the AUTOSAR_RTE_SWS.|

[SWS_DIt_00276]

Upstream requirements: RS LT 00009

The DIt module shall provide the possibility to trace all kinds of trace events described in the SWS RTE.

[SWS_DIt_00027] | The DIt module shall provide the implementation of the hook functions for every configured event given by an BswModuleEntry, which owns a short-Name starting with "Rte_Dlt" provided by the BswModuleDefinition of the RTE.

[SWS_DIt_00335] [The prototype of this hook function is to be taken from the Bsw ModuleEntry of the BSWModuleDescription of the RTE.]

7.1.3.2 Generating hook functions

[SWS Dlt 00285]

Upstream requirements: RS LT 00009

[Because the interface Dlt_SendTraceMessage is a SW-C interface, an internal function which is equivalent to Dlt_SendTraceMessage, shall be implemented to be called by the generated hook functions.]

[SWS Dlt 00277]

Upstream requirements: RS_LT_00009

[In the hook function the internal representation of Dlt_SendTraceMessage shall be called. This call shall be in non-verbose mode.]

[SWS_DIt_00278] [The payload for this hook function call shall be filled with the arguments provided by the hook function. All data transported with the arguments shall be provided.]

[SWS_DIt_00632] [The argument data shall be written in raw format to the payload.]

[SWS_DIt_00279] [Every hook function shall get its own DltSwcContextId.

In some cases some events can be bundled to the same ContextId. This shall mostly be done if a very large number of signals are traced.

[SWS_DIt_00337] [The ApplicationID shall be "VFBT".|

[SWS_DIt_00484] [The Message Type (MSTP) entry in the generated trace message shall be set to DLT_TYPE_APP_TRACE, the Message Trace Info (MSTI) entry in this case shall be set to DLT_TRACE_VFB.

[SWS_DIt_00280] [Because non-verbose mode is used, a unique Message ID as defined in [SWS_DIt_00031] shall be used for each call to Dlt_SendTraceMessage.]

Note: The description for the Message ID-payload shall be generated and provided. This description can be generated from the SW-C description file, were the interface is described.

[SWS_DIt_00281] In each hook function the trace status of the ContextId shall be checked, such that:

```
/*
    Check the trace status of the ContextId before calling Dlt_SendTraceMessage
    "vfb_actual_trace_status_contextXY" holds the trace status for a specific ContextId
*/
if (vfb_actual_trace_status_contextXY) {
    <internal_Dlt_SendTraceMessage>(...);
```

[SWS_DIt_00282] [DIt shall use for every VFB trace hook function an own DltSwc-ContextId and thus handle for every VFB trace DltSwcContextId a separate trace status. This can be done with a separate variable.

[SWS_DIt_00283] [A separate function shall be implemented to modify the trace status of VFB trace hook functions. This function shall be harmonized with the SW-C LogTraceSessionControl interface.|

7.1.4 Log messages from DEM

[SWS_DIt_00377] [The ApplicationID, ContextId and Message ID of a Log Message sent for a DEM event shall have the following values:

```
ApplicationID = "DEM"

ContextId = "STD0"
```

MessageID = 0×000000001

7.1.5 Log messages from DET

SW-Cs and BSW modules can report errors to the DET module. Such errors can be forwarded to the DIt module as messages with a suitable content using the Dlt_-DetForwardErrorTrace.

Note: All parameters from the DET function <code>Det_ReportError</code> are forwarded to the DIt function <code>Dlt DetForwardErrorTrace</code> by the DET fan-out capability.

[SWS DIt 00430]

Upstream requirements: RS_LT 00006

[The Dlt module shall provide the Dlt_DetForwardErrorTrace function for the fanout capability of DET.]

[SWS_DIt_00376] [The ApplicationID, ContextId and MessageID of the Log Message send by DET shall have the following values:

ApplicationID = "DET"

ContextId = "STD"

MessageID = 0×000000002

LogLevel = "Error" |

7.1.6 Recommendation for generation of Message IDs

The payload of non-verbose messages contains the Message ID. The Message ID shall be unique for an ECU. The problem is that Message IDs are provided by a SW-C (the user of Dlt) and at the point in time when coding of the log and trace message calls are done there is no instance to guarantee the uniqueness of used Message IDs.

A possible solution is to map all Log Messages in a virtual memory segment and then use the memory address as Message ID. Another solution is to have an authoring tool that is responsible for the uniqueness of the Message IDs.

In addition, it could be possible to fix Message ID values during the post build process, so uniqueness for the ECU can be guaranteed.

It is important to provide for every Message ID a description for the associated message.

[SWS_DIt_00031] [MessageIds used for DEM (0×000000001) and DET (0×000000002), and Trace Messages (0×000000003) are reserved and therefore not usable for SW-Cs.|

7.1.7 Startup behavior

The DIt module specifies several configuration parameters, which can be reconfigured during runtime via API calls or via DIt control messages.

This means, that those configuration parameters respectively data structures, which are based on them, have to be loaded into runtime variables during the startup of the Dlt module.

In addition, it might happen that SW-Cs and/or BSW modules are already generating log and trace data even though the Dlt module itself has not been initialized yet. For this scenario, the Dlt module offers the possibility to buffer even this data until the Dlt module is initialized.

The described functionalities result in the requirements below:

[SWS_DIt_00003]

Upstream requirements: RS LT 00036

[The DIt module shall be able to buffer data coming from calls to Dlt_SendLogMes-sage and/or Dlt_SendTraceMessage even if the DIt module has not been initialized yet.]

[SWS_DIt_00648] [When the Dlt_Init is called, the optional timer DltGeneral-StartUpDelayTimer shall be started if configured.]

[SWS_DIt_00649] [If the parameter DltGeneralNvRAMSupport is disabled, static Dlt module configuration shall be used for initialization.]

[SWS_DIt_00005] [As soon as the DIt module is initialized by Dlt_Init and the optional timer DltGeneralStartUpDelayTimer has expired, all the log and trace data, which has been buffered meanwhile, shall be processed according to [SWS_Dlt_00651], using the configured filter settings.]

7.1.8 Persistent storage of configuration

The Dlt module offers the possibility to store configuration data in the NVRamManager module. Therefore, it is recommended to call the Dlt_Init function only after the NVRamManager module has been initialized.

The persistency functionality of the Dlt module supports the non-volatile saving of configuration values, which are modifiable during runtime.

The idea is to allow to customize the logging configuration during runtime and to assure that this configuration is recovered after an ECU reset or restart.

[SWS_DIt_00451] [If the parameter DltGeneralNvRAMSupport is set to TRUE, non-volatile memory blocks shall be used by the Dlt module to store the current Dlt configuration persistently.]

[SWS_DIt_00449] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the Dlt module has to verify the validity of the non-volatile blocks used.]

[SWS_DIt_00350] [If the parameter DltGeneralNvRAMSupport is set to TRUE, the stored Dlt configuration shall be used as initial values.]

Note: Initial values in this case are the initial values for the persistent stored values for the first startup of the ECU.

[SWS_DIt_00078]

Upstream requirements: RS_LT_00039

[Storing the current configuration to NvRAM shall only be done if the parameter Dlt-GeneralNvRAMSupport is enabled and the storing has been explicitly requested by the Dlt Command Dlt_StoreConfiguration.]

Note: To store the current configuration to NvRAM, the API NvM_WriteBlock is used.

7.1.9 Sending of Log and Trace Messages

The Dlt data path describes the flow a Dlt Log and Trace Message takes from the source to the sink. The source can be either a SW-C or a BSW module, whereas the PDU Router is representing the sink.

Figure 7.2 provides an overview of the separate steps to send a DIt message on the communication bus:

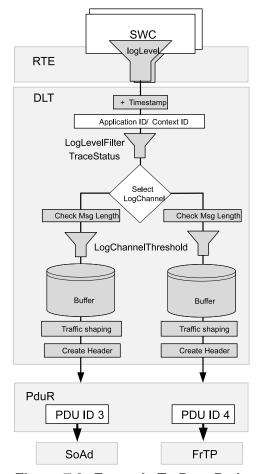

Figure 7.2: Example Tx Data Path

Sending of Log and Trace messages is done with the dedicated functions Dlt_Send-LogMessage and Dlt_SendTraceMessage.

Two additional functions exist that allow to give additional attributes to Log and Trace messages. These functions are named <code>Dlt_SendLogMessageWithAttributes</code> and <code>Dlt_SendTraceMessageWithAttributes</code> respectively. These two are pure supersets of the previously mentioned ones, which remain in the Standard for backwards-compatibility and convenience purposes, for the common case where no additional attributes are needed.

Please note that throughout this document, whenever the functions <code>Dlt_Send-LogMessage</code> or <code>Dlt_SendTraceMessage</code> are being mentioned, these need to be understood as a shorthand notation a for <code>Dlt_SendLogMessage</code> or <code>Dlt_SendLogMessage</code> or <code>Dlt_SendLogMessage</code> or <code>Dlt_SendTraceMessage</code> or <code>Dlt_SendTrac</code>

[SWS DIt 00787]

Status: DRAFT

[Calling the function Dlt_SendLogMessageWithAttributes with the parameter attributes set to NULL shall be equivalent to calling the function Dlt_SendLogMessage with the remaining parameters.]

[SWS DIt 00782]

Status: DRAFT

[Calling the function Dlt_SendTraceMessageWithAttributes with the parameter attributes set to NULL shall be equivalent to calling the function Dlt_SendTraceMessage with the remaining parameters.]

[SWS DIt 00783]

Status: DRAFT

[If the configuration parameter DltProtocolVersion is set to 1, a call to Dlt_SendLogMessageWithAttributes Or Dlt_SendTraceMessageWithAttributes where the attribute's argument is non-NULL, shall return with DLT_E_-NOT_SUPPORTED.

[SWS_DIt_00650] [The following steps describe the logical order, in the context of calls to Dlt SendLogMessage or Dlt SendTraceMessage:

- Generate timestamp (see chapter "Generating the timestamp")
- Filter message (see chapter "Message filtering")
- Select target LogChannel(s) (see chapter "Select target LogChannel")
- Check Message length (see chapter "Check message length")
- Apply the current LogChannel threshold (see chapter "Apply LogChannel LogLevelThreshold")
- Copy Dlt message to LogChannel specific buffer (see chapter "Copying Dlt message to the LogChannel buffer")
- Apply the message attributes, if any are present and supported (see chapter "Apply the message attributes, if any are present and supported")

Note: Because of optimizations in an implementation, the order might be changed. For instance, a typical optimization could be, that the Dlt header, which is created by Dlt module for each Dlt message, is NOT saved to the LogChannel specific buffer per Dlt message, but is created on-the-fly directly before sending the message to PduR.

[SWS_DIt_00651] [The following steps have to be taken deferred/decoupled from the context of calls to Dlt_SendLogMessage or Dlt_SendTraceMessage:

- Send Dlt message to PduR according to TrafficShaping settings (see chapter "Sending messages from LogChannel Buffer")
- Create Dlt Header according to header settings (see chapter "Create Dlt message header")
- Remove the Dlt message from the LogChannel specific buffer (see chapter "Removing messages from LogChannel buffer")

7.1.9.1 Generating the timestamp

Depending of the current configuration, a timestamp may be added to the Dlt message.

[SWS_DIt_00652] [Only if the parameter DltHeaderUseTimestamp is set to TRUE, shall the Dlt module fetch a timestamp.]

[SWS_DIt_00653] [If the parameter DltHeaderUseTimestamp is set to TRUE, but the Dlt module cannot fetch a timestamp for any reason, the timestamp shall be set to 0×00000000 .

[SWS_DIt_00654] [If the parameter DltHeaderUseTimestamp is set to TRUE and DltGeneralGptChannelRef is configured, the Dlt module shall call the API Gpt_GetTimeElapsed with the configured channel reference (see DltGeneral-GptChannelRef) to fetch the elapsed time.]

[SWS_DIt_00655] [If the parameter DltHeaderUseTimestamp is set to TRUE and DltGeneralStbMTimeBaseRef is configured, the Dlt module shall call the API StbM_GetCurrentTime with the configured time base reference (see DltGeneral-StbMTimeBaseRef) to fetch the current synchronized time and calculate the elapsed time.]

7.1.9.2 Message filtering

Message filtering means to accept or discard an incoming log or trace message based on the <code>DltSwcApplicationId/DltSwcContextId</code> tuple, which is assigned to that message.

Filtering differs slightly between Log Messages (Dlt_SendLogMessage) and trace messages (Dlt_SendTraceMessage).

[SWS_DIt_00656] [For DIt Log Messages, the highest LogLevel Threshold shall be defined as DLT_LOG_VERBOSE |

[SWS_DIt_00657] [For DIt Log Messages, the lowest LogLevel Threshold shall be defined as DLT_LOG_OFF.]

Note: The Dlt_MessageLogLevelType defines all possible Log Message filter levels.

[SWS_DIt_00658] [For Log Message filtering the DIt internally manages LogLevel threshold to DltSwcApplicationId/DltSwcContextId tuple mappings (see configuration parameter DltLogLevelThreshold).

[SWS_DIt_00659] [For trace message filtering the DIt internally manages trace activation state to DltSwcApplicationId/DltSwcContextId tuple mappings (see configuration parameter DltTraceStatusAssignment).

Note: The matching algorithm for finding the proper mapping element (containing a threshold log level value in the Log Message case respectively containing a trace activation state in the trace message case) is identical for Log Messages and trace messages.

[SWS_DIt_00661] [The DIt module shall find a matching mapping element (log level threshold respectively trace activation state) for the DltSwcApplicationId/DltSwcContextId tuple contained in a Dlt_SendLogMessage or Dlt_SendTraceMessage call. To do so, the following steps shall be performed:

- Check whether a mapping element exists, where <code>DltSwcApplicationId/DltSwcContextId</code> tuple of mapping element equals to the <code>DltSwcApplicationId/DltSwcContextId</code> tuple of the log/trace message. If such a mapping element exists, the matching mapping element is found.
- In case no match has been found in step 1, check whether a mapping element exists, where the DltSwcApplicationId equals the ApplicationID of the log/trace message and the DltSwcContextId of mapping element equals wildcard (value 0x00000000). If such a mapping element exists, the matching mapping element is found.
- In case no match has been found in step 1 and 2, the matching mapping element is the current DefaultLogLevelThreshold respectively the current Default TraceStatus.

[SWS_DIt_00662] [In the Dlt_SendLogMessage case, the found mapping element is a log level threshold. If the log level value of the Log Message is numerically higher than this log level threshold, the Log Message is not further processed and E_OK is returned.]

[SWS_DIt_00663] [In the Dlt_SendTraceMessage case, the found mapping element is a trace activation state. If the value of the trace activation state is FALSE, the message is not further processed and E_OK is returned.

7.1.9.3 Select target LogChannel

In this step, the DIt module identifies on which LogChannel(s) the log or trace message will be transmitted.

[SWS_DIt_00664] [For LogChannel selection the DIt module manages LogChannel to DltSwcApplicationId/DltSwcContextId tuple mappings. (see configuration parameter DltLogChannelAssignmentSwcContextRef).

Note: There can be several LogChannels configured for a given DltSwcApplicationId/DltSwcContextId tuple contained in a Dlt_SendLogMessage or Dlt_-SendTraceMessage call.

[SWS_DIt_00665] [To find the matching LogChannels for the DltSwcApplicationId/DltSwcContextId tuple contained in a Dlt_SendLogMessage or Dlt_SendTraceMessage call, the Dlt module shall do the following steps:

- From all mapping elements, where DltSwcApplicationId/DltSwcContextId tuple of mapping element equals to the DltSwcApplicationId/DltSwcContextId tuple of the log/trace message, the LogChannel shall be added to the list of output LogChannels.
- From all mapping elements, where ApplicationID of mapping element equals to the ApplicationID of the log/trace message AND the ContextId of mapping element equals wildcard (value 0x0000000), the LogChannel shall be added to the list of output LogChannels.
- If the list of output LogChannels is still empty after step 1 and 2. The default Log Channel (see configuration parameter DltDefaultLogChannelRef) shall be added to the list of output LogChannels.

1

7.1.9.4 Check message length

[SWS_DIt_00666] [If the Dlt message length including the required Dlt headers exceeds the configured value given by DltLogChannelMaxMessageLength for all assigned LogChannels, discard this Dlt message and return DLT_E_MSG_TOO_LARGE.]

Note: If the message is short enough for at least one assigned LogChannel, continue to process this message for all LogChannels where the message is short enough.

7.1.9.5 Apply LogChannel LogLevelThreshold

In this step, the DIt module decides, individually for each identified log and trace channel, whether the current log or trace message may pass or not.

[SWS_DIt_00667] [Log messages with a log level numerically higher than the configured value of LogChannel threshold for the identified LogChannel shall be discarded and E_OK shall be returned. This shall be done on each LogChannel from the list of output LogChannels for the Log Message, considering [SWS_DIt_00665].]

[SWS_DIt_00668] [Trace messages shall be filtered out, when the config parameter DltTraceStatus is FALSE for the identified LogChannel. That means they do not proceed to the next processing step and E_OK is returned.]

7.1.9.6 Copying Dlt message to the LogChannel buffer

In this step the Dlt module copies the Dlt message to all buffers of the LogChannels, which the Dlt message is assigned to.

[SWS_DIt_00669] [The DIt module shall copy the log/trace message which has passed the message filters to all assigned target LogChannel buffers where the DIt message length is not larger than DltLogChannelMaxMessageLength of the respective LogChannel.|

[SWS_DIt_00670] [If there was not enough space to copy the complete message to any of the assigned LogChannel's buffer, DLT_E_NO_BUFFER shall be returned and the DIt log and trace message shall be discarded.

In addition, check each assigned buffer whether it was already full before, i.e., check DIt internal flags to store a buffer overflow event:

• If the buffer overflow flag is currently not set for this buffer:

- Set the buffer overflow flag to indicate the occurrence of a buffer overflow
- The DIt log and trace message shall be discarded
- If the buffer overflow flag for this buffer was already set for this buffer:
 - The DIt log and trace message shall be discarded
- Send Dlt Control Message(s) "BufferOverflowNotification" according to the configuration. Please refer to chapter ("BufferOverflowNotification")

Note: The cyclically called Dlt_TxFunction checks the status of the buffer overflow flag and the de-bounce time for sending buffer overflow notifications. This function also sets back the flag cyclically according to a buffer overflow notification.

[SWS_DIt_00671] [If a new message has been copied successfully to the assigned LogChannel's buffer, the message counter shall be increased by 1. This message counter value shall be stored for the DIt message.|

Note: When the Dlt message is going to be transmitted, this message counter value will be written into the Message Counter Field (MCNT).

[SWS_DIt_00672] [If a new message has been copied successfully to at least one LogChannel buffer, DLT_OK shall be returned. |

7.1.9.7 Apply the message attributes, if any are present and supported

Optional attributes can be added to a message when using the APIs <code>Dlt_SendLogMessageWithAttributes</code> or <code>Dlt_SendTraceMessageWithAttributes</code>, and if the configuration parameter <code>DltProtocolVersion</code> is set to 2 or higher.

The attributes are given as an additional function argument of type pointer to Dlt_-MessageAttributesType.

The Dlt_MessageAttributesType structure has been designed to be extensible; any future extension of this structure will be provided as new fields, either with an in-band "invalid" state (e.g. a null pointer), or with a separate bool flag denoting the existence of a meaningful value for the subsequent field.

Therefore, prior to calling a function defined in this standard which reads values from a Dlt_MessageAttributesType structure (such as Dlt_SendLogMessageWith-Attributes), the application shall ensure that all members of the structure, including any additional non-standardized members, are initialized with default initialization.

This can be done, for instance, with:

```
Dlt_MessageAttributesType attributes = { 0 };
```

The messageTags field of the Dlt_MessageAttributesType type constitutes a pointer to an array of strings. This array has to be "terminated" with a null-pointer.

An implementation might typically read this field with code such as:

```
const char** tags = attributes->messageTags;
int i;
for (i = 0; tags && (tags[i] != NULL); ++i) {
    const char* t = tags[i];
    ....
}
```

7.1.9.8 Sending messages from LogChannel Buffer

[SWS_DIt_00780] [The sending of DIt messages via the PduR API shall be decoupled from the Dlt_SendLogMessage and Dlt_SendTraceMessage API call.]

Note: The decoupling is done because of the following reasons:

- Shortening runtime of calls from the SW-Cs/BSWs which trigger log/trace messages, to reduce blocking time.
- In case traffic shaping functionality is enabled, the transmissions have to be processed by an asynchronous cyclic BSW entity anyway.
- In case retry feature is enabled a decoupled BSW entity, which cares for retries, is needed anyway.

[SWS_DIt_00673] [The DIt module shall transmit DIt messages collected in the Log Channel specific buffer from the context of the Dlt_TxFunction function.]

[SWS_DIt_00674] [The DIt Message Header shall be assembled before $PduR_Dlt-Transmit$ is called.]

Note: For details regarding the assembling of the Dlt Message Header, please refer to the next section.

[SWS_DIt_00675] [The DIt module shall use the PduR_DltTransmit function to send the DIt message with the configured DltTxPduId.]

[SWS_DIt_00677] [The DIt module shall monitor a transmit counter for each DIt message in a LogChannel specific buffer. Each time it calls PduR_DltTransmit for a DIt message in the buffer, it shall increment the transmit counter.]

7.1.9.9 Create Dlt message header

[SWS_DIt_00676] [If the parameter <code>DltProtocolVersion</code> is set to 2 or higher, then the WTGS bit shall be set to <code>TRUE</code> if the value of the messageTags field of the <code>Dlt_MessageAttributesType</code> value that has been passed to the API <code>Dlt_SendLogMessageWithAttributes</code> or <code>Dlt_SendTraceMessageWithAttributes</code> is a non-NULL pointer. Otherwise, the WTGS bit shall be set to <code>FALSE.</code>

[SWS_DIt_00660] [If the parameter DltProtocolVersion is set to 2 or higher, and the WTGS bit has been set to TRUE, then the TAGS field shall be written as follows:

- 1. The NOTG field shall be set to the number of non-NULL pointers contained in the array pointed to by the messageTags field of the Dlt_MessageAttributesType value that has been passed to the API Dlt_SendLogMessageWithAttributes or Dlt_SendTraceMessageWithAttributes.
- 2. The strings pointed to by the messageTags array entries shall be written according to the rules defined by PRS Dlt 01031.

Otherwise, the TAGS field shall be omitted.

7.1.9.9.1 Assembling the DIt Header

[SWS_DIt_00678] [The UEH bit shall be set to 1 if at least one of the parameters DltUseVerboseMode or DltUseExtHeaderInNonVerbMode is set to TRUE. Otherwise, the UEH bit shall be set to 0.]

[SWS_DIt_00679] [The MSBF bit shall be set to 1 if the current platform is ${\tt BIGEN-DIAN.}$

[SWS_DIt_00680] [The MSBF bit shall be set to 0 if the current platform is LITTLEENDIAN. \mid

[SWS_DIt_00681] [The WEID bit shall be set to 1 if the parameter Dlt-HeaderUseEculd is set to TRUE. Else, the WEID bit shall be set to 0.]

[SWS_DIt_00682] [The WSID bit shall be set to 1 if the parameter DltHeaderUs-eSessionID is set to TRUE. Else, the WSID bit shall be set to 0.]

[SWS_DIt_00683] [The WTMS bit shall be set to 1 if the parameter DltHeaderUse-Timestamp is set to TRUE. Else, the WSID bit shall be set to 0.]

[SWS DIt 00684] [The VERS bits shall always be set to 001.]

[SWS_DIt_00685] [The MCNT field shall be set to the stored value of this Dlt message when it is copied to the LogChannel's buffer.]

[SWS_DIt_00686] [The optional ECU field shall only exist if DltHeaderUseEcuId is set to TRUE.|

[SWS_DIt_00687] [The optional ECU field shall be set to the value configured in DltEcuIdValue. If the configured ECU IDis shorter than 4 byte, the remaining bytes shall be set to 0×00 .]

[SWS_DIt_00688] [The optional SEID field shall be set to the value configured via DltSwcSessionId and shall only exist if DltHeaderUseSessionID is set to TRUE.]

[SWS_DIt_00689] [The optional TMSP field shall contain the derived timestamp if DltHeaderUseTimestamp is set to TRUE.]

[SWS_DIt_00690] [The LEN field shall be set to the overall length of the finally assembled Dlt Data Message, which shall be the sum of the length of the Header, the length of the optional Extended Header, and the length of the Payload.

[SWS_DIt_00784] [If the parameter DltProtocolVersion is set to 2 or higher, then the WPVL bit shall be set to the value of the withPrivacyLevel field of the Dlt_MessageAttributesType value that has been passed to the API Dlt_SendLogMessageWithAttributes Or Dlt_SendTraceMessageWithAttributes. Otherwise, the WPVL bit shall be set to FALSE.]

[SWS_DIt_00785] [If the parameter <code>DltProtocolVersion</code> is set to 2 or higher, and the WPVL bit has been set to <code>TRUE</code>, then the PRLV field shall be set to the value of the <code>privacyLevel</code> field of the <code>Dlt_MessageAttributesType</code> value that has been passed to the API <code>Dlt_SendLogMessageWithAttributes</code> or <code>Dlt_SendTraceMessageWithAttributes</code>. Otherwise, the PRLV field shall be omitted.

7.1.9.9.2 Assembling the Dlt Extended Header

[SWS_DIt_00691] [If the parameter DltUseExtHeaderInNonVerbMode is set to TRUE, the Dlt Extended Header has to be generated for Dlt Data Messages:

[SWS_DIt_00692] [The VERB bit shall be set to '1 'if the parameter DltUseVerboseMode is set to TRUE. Else, the VERB bit shall be set to 0.|

[SWS_DIt_00693] [The MSTP field shall be set to 0×0 if the DIt message has to be assembled due to the API call Dlt_SendLogMessage.]

[SWS_DIt_00694] [The MSTP field shall be set to 0×1 if the DIt message has to be assembled due to the API call Dlt_SendTraceMessage.]

[SWS_DIt_00695] [The MTIN field shall be set accordingly to the DIt_MessageLogInfo Typ value, which has been passed by the API Dlt_SendLogMessage.]

[SWS_DIt_00696] [The MTIN field shall be set accordingly to the DIt_MessageTrace InfoType value, which has been passed by the API Dlt_SendTraceMessage.]

7.1.9.10 Removing messages from LogChannel buffer

[SWS_DIt_00697] [A DIt message, for which PduR_DltTransmit has been called, shall be removed from the LogChannel specific buffer in the following cases:

- PduR_DltTransmit has returned with E_NOT_OK,
- A positive TX confirmation for this TxPduId has been received, or
- A negative TX confirmation for this DltTxPduId has been received and the transmit counter of the Dlt message is greater than the configured DltLogChannelMaxNumOfRetries.

7.1.10 Receiving of Dlt commands

The Dlt module can receive Dlt commands via the Rx Data Path and/or via dedicated API calls (see 8). These Dlt commands can be used to control the Dlt module.

[SWS_DIt_00698] [The DIt module shall ignore all received DIt control messages via the Rx Data Path in case the parameter <code>DltGeneralRxDataPathSupport</code> is set to <code>FALSE.</code>

Note: In case the Rx Data Path is disabled, the Dlt client can be controlled via the optional control APIs defined in 8.

[SWS_DIt_00699] [If DltGeneralRxDataPathSupport is set to TRUE, the Dlt module shall process received Dlt control messages.]

[SWS_DIt_00700] [If a received DIt command has been executed successfully, OK shall be returned.]

7.1.10.1 SetLogLevel

[SWS_DIt_00701] [If the DIt command Dlt_SetLogLevel is requested, the new Log Level shall be stored for the received tuple of DltSwcApplicationId/DltSwcContextId.]

[SWS_DIt_00702] [If the Dlt command Dlt_SetLogLevel is requested, but the received tuple of DltSwcApplicationId/DltSwcContextId is unknown, the Dlt command shall be answered with DLT_E_ERROR.|

7.1.10.2 SetTraceStatus

[SWS_DIt_00703] [If the DIt command Dlt_SetTraceStatus is requested, the new trace status shall be stored for the received tuple of DltSwcApplicationId/DltSwcContextId.|

[SWS_DIt_00704] [If the DIt command Dlt_SetTraceStatus is requested, but the addressed tuple of DltSwcApplicationId/DltSwcContextId is unknown, the DIt command shall be answered with DLT_E_ERROR.]

7.1.10.3 GetLogInfo

[SWS_DIt_00705] [If the DIt command Dlt_GetLogInfo is requested, the requested logInfo shall be returned.]

[SWS_DIt_00706] [If the Dlt command Dlt_GetLogInfo is requested, but the addressed tuple of DltSwcApplicationId/DltSwcContextId is unknown, the Dlt command shall be answered with DLT_E_ERROR.|

7.1.10.4 GetDefaultLogLevel

[SWS_DIt_00708] [If the DIt command Dlt_GetDefaultLogLevel is requested, the current value of the parameter DltDefaultLogLevel shall be returned.]

7.1.10.5 StoreConfiguration

[SWS_DIt_00709] [If the DIt command Dlt_StoreConfiguration is requested and the configuration parameter DltGeneralNvRAMSupport is set to TRUE, the following steps shall be performed:

- Call NvM_WriteBlock to store the current configuration of the LogChannelAssignment, LogChannelThreshold, and the LogLevelFilter.
 - If NvM_WriteBlock returned with E_OK, the Dlt command Dlt_Store-Configuration shall return with E_OK.
 - If NvM_WriteBlock returned with something else than E_OK, the Dlt command Dlt_StoreConfiguration shall return with DLT_E_ERROR.

[SWS_DIt_00710] [If the DIt command Dlt_StoreConfiguration is requested and the configuration parameter DltGeneralNvRAMSupport is set to FALSE, the Dlt command Dlt_StoreConfiguration shall return DLT_E_NOT_SUPPORTED.]

7.1.10.6 ResetToFactoryDefault

[SWS_DIt_00711] [If the DIt command Dlt_ResetToFactoryDefault is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, reset the following runtime parameters to the values stored in the DIt module's static configuration:

- DltDefaultLogLevel
- DltThreshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

[SWS_DIt_00712] [If the DIt command Dlt_ResetToFactoryDefault is requested and if the parameter DltGeneralNvRAMSupport is set to TRUE, delete the stored configuration of the NvM by calling NvM_EraseNvBlock and reset the following runtime parameters to the values stored in the Dlt module's static configuration:

- DltDefaultLogLevel
- Dlt.Threshold
- DltDefaultTraceStatus
- DltLogChannelThreshold
- DltDefaultLogChannelRef

[SWS_DIt_00713] [If the Dlt command Dlt_ResetToFactoryDefault is requested and if the parameter DltGeneralNvRAMSupport is set to FALSE, E_OK shall be returned if the Dlt module reset the current configuration values to the default configuration successfully.]

[SWS_DIt_00714] [If the DIt command Dlt_ResetToFactoryDefault is requested and the parameter DltGeneralNvRAMSupport is set to TRUE, response with "ERROR"

- if the Dlt module could not reset the current configuration to the static default configuration or
- if the stored configuration of the NvM could not be deleted.

7.1.10.7 SetMessageFiltering

[SWS_DIt_00775] [If the DIt command Dlt_SetMessageFiltering is requested, all the DIt filters shall be enabled/disabled as requested, and the DIt command shall be answered with E_OK . Disabled filters will allow all messages to pass.]

7.1.10.8 SetDefaultLogLevel

[SWS_DIt_00715] [If the DIt command Dlt_SetDefaultLogLevel is requested, the parameter DltDefaultLogLevel shall be updated to the received newLogLevel.]

7.1.10.9 SetDefaultTraceStatus

[SWS_DIt_00716] [If the DIt command Dlt_SetDefaultTraceStatus is requested, the parameter DltDefaultTraceStatus shall be updated to the received newTraceStatus]

7.1.10.10 GetDefaultTraceStatus

[SWS_DIt_00717] [If the DIt command Dlt_GetDefaultTraceStatus is requested, the current value of the parameter DltDefaultTraceStatus shall be returned.]

7.1.10.11 GetLogChannelNames

[SWS_DIt_00718] [If the DIt command Dlt_GetLogChannelNames is requested, the number of configured LogChannels and requested number of LogChannel names given by the parameter DltLogChannelName shall be returned.]

7.1.10.12 GetTraceStatus

[SWS_DIt_00719] [If the DIt Command Dlt_GetTraceStatus is requested, the DltLogTraceStatusFlag shall be returned for the received tuple of DltSwcApplicationId/DltSwcContextId.]

7.1.10.13 SetLogChannelAssignment

[SWS_DIt_00720] [If the Dlt command Dlt_SetLogChannelAssignment is requested with parameter addRemoveOp set to DLT_ASSIGN_ADD, add the tuple of DltSwcApplicationId/DltSwcContextId to the LogChannel with the name provided by the parameter logChannelName. The Dlt command shall return E_OK even if the tuple was already assigned to the requested LogChannel before.]

[SWS_DIt_00721] [If the DIt command Dlt_SetLogChannelAssignment is requested with parameter addRemoveOp set to DLT_ASSIGN_REMOVE, remove the tuple

of DltSwcApplicationId/DltSwcContextId from the LogChannel with the name provided by the parameter logChannelName. The Dlt command shall return E_OK even if the tuple was not assigned to the requested LogChannel before.

Note: If a tuple of <code>DltSwcApplicationId/DltSwcContextId</code> is not assigned explicitly to any specific LogChannel (any more), the mandatory default LogChannel (see <code>DltDefaultLogChannelRef</code>) will be used for transmission.

[SWS_DIt_00722] [If the DIt command Dlt_SetLogChannelAssignment is requested with an unknown tuple of DltSwcApplicationId/DltSwcContextId or an unknown LogChannel name, the DIt command shall return DLT_E_ERROR.]

7.1.10.14 SetLogChannelThreshold

[SWS_DIt_00723] [If the DIt command Dlt_SetLogChannelThreshold is requested, the DltLogChannelThreshold of the addressed LogChannel shall be set to the value received by the parameter newThreshold

1

[SWS_DIt_00724] [If the DIt command Dlt_SetLogChannelThreshold is requested and the logChannelName and/or the newThreshold is unknown, the DIt command shall return DLT_E_ERROR.|

7.1.10.15 GetLogChannelThreshold

[SWS_Dlt_00725] [If the Dlt command Dlt_GetLogChannelThreshold is requested, the DltLogChannelThreshold of the addressed LogChannel shall be returned.]

[SWS_DIt_00726] [If the DIt command Dlt_GetLogChannelThreshold is requested and the logChannelName or the logChannelThreshold is unknown, the DIt command shall return DLT_E_ERROR.]

7.1.11 Sending of Dlt commands

Typically, the Dlt module receives Dlt commands generated by a Dlt logging tool, which are answered by the Dlt module. Only two Dlt commands are triggered for sending by the Dlt module itself:

- Dlt_GetLogInfo (only in case one or more SW-Cs register/unregister themselves)
- BufferOverflowNotification ([PRS_Dlt_00769] in case of a buffer overflow).

7.1.11.1 BufferOverflowNotification

The buffer overflow notification ([PRS_Dlt_00769]) is used to inform the Dlt Logging tool about the loss of Dlt messages. The amount of <code>BufferOverflowNotifications</code> on the bus can be limited/de-bounced by configuration. This notification contains a counter which indicates the amount of lost Dlt messages since the last <code>BufferOverflowNotification</code>.

[SWS_DIt_00776] [If the DIt module detects a buffer overflow, it shall send a DIt command BufferOverflowNotification cyclically (see DltLogChannelBuffer-OverflowTimer) as long as the buffer is still full.]

[SWS_DIt_00777] [The parameter BufferOverflowNotification.overflow-Counter of the DIt control message "BufferOverflowNotification" shall be set to the number of lost DIt messages since the last transmission of the BufferOverflowNotification.]

7.2 Error Classification

Section "Error Handling" of the document [5] "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.2.1 Development Errors

[SWS_Dlt_00727] Definiton of development errors in module Dlt [

Type of error	Related error code	Error value
API service called with wrong parameter	DLT_E_PARAM	0x01
Null pointer has been passed as an argument	DLT_E_PARAM_POINTER	0x02
Initialization failed	DLT_E_INIT_FAILED	0x03
Registration failed	DLT_E_REGISTRATION	0x04

1

7.2.2 Runtime Errors

[SWS_Dlt_00728] Definiton of runtime errors in module Dlt [

Type of error	Related error code	Error value
Message could not be sent	DLT_E_SKIPPED_TRANSMISSION	0x05
A deprecated parameter with a value different to 0 for a Dlt command has been received	DLT_E_DEPRECATED_PARAMETER	0x06
Multiple Control Requests at the same time	DLT_E_MULTIPLE_REQUESTS	0x07

7.2.3 Production Errors

There are no production errors.

7.2.4 Extended Production Errors

There are no extended production errors.

8 API specification

8.1 Imported types

In this section all types imported from the following modules are listed:

[SWS_Dlt_91009] Definition of imported datatypes of module Dlt [

Module	Header File	Imported Type
Comtype	ComStack_Types.h	BufReq_ReturnType
	ComStack_Types.h	PduldType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
	ComStack_Types.h	RetryInfoType
	ComStack_Types.h	TpDataStateType
Gpt	Gpt.h	Gpt_ChannelType
	Gpt.h	Gpt_ValueType
NvM	Rte_NvM_Type.h	NvM_BlockIdType
StbM	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_TimeTupleType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

8.2 Type definitions

8.2.1 Dlt_ConfigType

[SWS_Dlt_00437] Definition of datatype Dlt_ConfigType

Upstream requirements: SRS BSW 00414

Γ

Name	Dlt_ConfigType
Kind	Structure
Elements	implementation specific

	Туре	-
	Comment	The content of the initialization data structure is implementation specific
Description	This is the type of the data structure containing the initialization data for Dlt.	
Available via	Dlt.h	

8.2.2 Dlt_MessageType

[SWS_DIt_00224] Definition of datatype Dlt_MessageType \lceil

Name	Dlt_MessageType		
Kind	Enumeration		
Range	DLT_TYPE_LOG	0x00	A log message
	DLT_TYPE_APP_TRACE	0x01	A trace message
	DLT_TYPE_NW_TRACE	0x02	A message forwarded from a communication bus (like CAN, FlexRay)
	DLT_TYPE_CONTROL	0x03	A message for internal use/control sent between Dlt module and external client.
Description	This type describes the type of the message.		
Available via	Dlt.h		

ı

8.2.3 Dlt_MessageIDType

[SWS_Dlt_00228] Definition of datatype Dlt_MessageIDType

Status: OBSOLETE

ſ

Name	Dlt_MessageIDType (obsolete)		
Kind	Array Element type uint8		uint8
Size	4 Elements		
Description	Contains the unique MessageId for a message. This is only relevant in non-verbose mode.		
	Tags: atp.Status=obsolete		
Available via	Dlt.h		

8.2.4 Dlt_MessageNetworkTraceInfoType

[SWS_Dlt_00233] Definition of datatype Dlt_MessageNetworkTraceInfoType [

Name	Dlt_MessageNetworkTraceInfoType		
Kind	Enumeration		
Range	DLT_NW_TRACE_IPC	0x01	Inter process communication
	DLT_NW_TRACE_CAN	0x02	CAN communication
	DLT_NW_TRACE_ FLEXRAY	0x03	Flexray communication
	DLT_NW_TRACE_MOST	0x04	MOST communication
	DLT_NW_TRACE_ ETHERNET	0x05	Ethernet communication
	DLT_NW_TRACE_SOMEIP	0x06	SOME/IP communication
Description	This type describes transported type of a Dlt BUSMESSAGE.		
Available via	Dlt.h		

I

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 Dlt_Init

[SWS DIt 00239] Definition of API function DIt Init

Upstream requirements: SRS_BSW_00344, SRS_BSW_00404, SRS_BSW_00405, SRS_BSW_00101, SRS_BSW_00407, SRS_BSW_00358, SRS_BSW_00414

Γ

Service Name	Dlt_Init	Dlt_Init		
Syntax	<pre>void Dlt_Init (const Dlt_ConfigTy)</pre>	<pre>void Dlt_Init (const Dlt_ConfigType* config)</pre>		
Service ID [hex]	0x01	0x01		
Sync/Async	Synchronous	Synchronous		
Reentrancy	Non Reentrant	Non Reentrant		
Parameters (in)	config	config Pointer to a DLT configuration structure		
Parameters (inout)	None	None		
Parameters (out)	None	None		
Return value	None			

Description	DIt is using the NVRamManager and is to be initialized very late in the ECU startup phase. The DIt_Init() function should be called after the NVRamManager is initialized.
Available via	Dlt.h

[SWS DIt 00453]

Upstream requirements: RS_LT_00039

[If the parameter <code>DltGeneralNvRAMSupport</code> is set to <code>TRUE</code>, the Dlt module shall use the API <code>NvM_ReadBlock</code> of the NVRAM module for restoring the values from persistent storage for the variables required by [SWS_Dlt_00239] in the <code>Dlt_Init</code> function. \mid

8.3.2 Dlt_GetVersionInfo

[SWS_DIt_00271] Definition of API function Dlt_GetVersionInfo

Upstream requirements: SRS_BSW_00402

Γ

Service Name	Dlt_GetVersionInfo		
Syntax	<pre>void Dlt_GetVersionInfo (Std_VersionInfoType* versioninfo)</pre>		
Service ID [hex]	0x02		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	versioninfo Pointer to where to store the version information of this module.		
Return value	None		
Description	Returns the version information of this module.		
Available via	Dlt.h		

8.3.3 Dlt_SendTraceMessage

[SWS_DIt_00243] Definition of API function DIt_SendTraceMessage

Upstream requirements: RS_LT_00003

Γ

Service Name	Dlt_SendTraceMessage		
Syntax	<pre>Std_ReturnType Dlt_SendTraceMessage (Dlt_SessionIDType sessionId, const Dlt_MessageTraceInfoType* traceInfo, const uint8* traceData, uint16 traceDataLength)</pre>		
Service ID [hex]	0x04		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	sessionId Number of the module (Module ID within BSW, Port defined argument value within SW-C)		
	traceInfo	Structure containing the relevant information for filtering the message.	
	traceData	Buffer containing the parameters to be traced. The contents of this pointer represents the payload of the Trace Message to be sent.	
	traceDataLength	Length of the data buffer traceData	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType E_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels. DLT_E_NO_BUFFER: Not enough buffer available, the Dlt message cannot be buffered for at least one LogChannel. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.		
Description	The service represents the interface to be used by basic software modules or by software components to trace parameters.		
Available via	Dlt.h		

8.3.4 Dlt_SendLogMessage

[SWS_Dlt_00241] Definition of API function Dlt_SendLogMessage

Upstream requirements: RS_LT_00003

Γ

Service Name	Dlt_SendLogMessage	
Syntax	Std_ReturnType Dlt_SendLogMessage (Dlt_SessionIDType sessionId, const Dlt_MessageLogInfoType* logInfo, const uint8* logData, uint16 logDataLength)	
Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number
	logInfo	Structure containing the relevant information for filtering the message.
	logData	Buffer containing the parameters to be logged. The contents of this pointer represents the payload of the Log Message to be sent.
	logDataLength	Length of the data buffer logData.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description	The service represents the interface to be used by basic software modules or by software component to send Log Messages.	
Available via	Dlt.h	

8.3.5 Dlt_RegisterContext

[SWS_DIt_00245] Definition of API function DIt_RegisterContext

Upstream requirements: RS_LT_00033

Γ

Service Name	Dlt_RegisterContext	Dlt_RegisterContext	
Syntax	Std_ReturnType Dlt_RegisterContext (Dlt_SessionIDType sessionId, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, const uint8* appDescription, uint8 appDescLen, const uint8* contextDescription, uint8 contextDescLen		
Service ID [hex]	0x05		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	sessionId	number of the module (Module ID within BSW, Port defined argument value within SW-C)	
	appld	the ApplicationId	
	contextld	the ContextId	
	appDescription	Points to description string for the provided ApplicationId. At maximum 255 characters are interpreted.	
	appDescLen	The length of the description for the ApplicationId string (number of characters of description string).	
	contextDescription	Points to description string for the provided context. At maximum 255 characters are interpreted.	
	contextDescLen	The length of the description string (number of characters of description string).	
Parameters (inout)	None		
Parameters (out)	None	None	
Return value	Std_ReturnType	E_OK: The required operation succeeded. DLT_E_CONTEXT_ALREADY_REG: The software module context has already registered. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.	
Description	The service has to be called when a software module wants to use services offered by DLT software component for a specific context. If a Contextld is being registered for an already registered ApplicationId then appDescription can be NULL and len_appDescription zero.		
Available via	Dlt.h	Dit.h	

⅃

8.3.6 Dlt_UnregisterContext

[SWS_DIt_00769] Definition of API function Dlt_UnregisterContext

Upstream requirements: RS_LT_00033

Γ

Service Name	Dlt_UnregisterContext	
Syntax	Std_ReturnType Dlt_UnregisterContext (Dlt_SessionIDType sessionId, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId)	
Service ID [hex]	0x16	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	sessionId	number of the module (Module ID within BSW, Port defined argument value within SW-C)
	appld	the ApplicationId
	contextId	the ContextId
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: The required operation succeeded. DLT_E_CONTEXT_NOT_YET_REG: The software module context has not registered before. DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown.
Description	The service has to be called when a software module is going to be stopped.	
Available via	Dlt.h	

8.3.7 Dlt_DetForwardErrorTrace

[SWS_DIt_00432] Definition of API function Dlt_DetForwardErrorTrace

Upstream requirements: RS_LT_00006

Γ

Service Name	Dlt_DetForwardErrorTrace
Syntax	<pre>void Dlt_DetForwardErrorTrace (uint16 moduleId, uint8 instanceId, uint8 apiId, uint8 errorId)</pre>
Service ID [hex]	0x07
Sync/Async	Synchronous

Reentrancy	Non Reentrant		
Parameters (in)	moduleld	Module ID of calling module.	
	instanceId	The identifier of the index based instance of a module, starting from 0. If the module is a single instance module it shall pass 0 as the instanceld.	
	apild	ID of API service in which error is detected (defined in SWS of calling module)	
	errorld	ID of detected development error (defined in SWS of calling module).	
Parameters (inout)	None	·	
Parameters (out)	None	None	
Return value	None		
Description	Service to forward error	Service to forward error reports from Det to Dlt.	
Available via	Dlt_Det.h	Dlt_Det.h	

8.3.8 Dlt_SetLogLevel

[SWS_DIt_00252] Definition of API function DIt_SetLogLevel

Upstream requirements: RS_LT_00004, RS_LT_00038

Γ

Service Name	Dlt_SetLogLevel	
Syntax	Std_ReturnType Dlt_SetLogLevel (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, Dlt_MessageLogLevelType newLogLevel)	
Service ID [hex]	0x08	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	appld ID of the SW-C	
	contextId	ID of the context
	newLogLevel	new log level to set
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogLevel could not be changed
Description	This service is used to change the LogLevel for the given tuple of ApplicationID/ContextID.	
Available via	Dlt.h	

8.3.9 Dlt_SetTraceStatus

[SWS_Dlt_00254] Definition of API function Dlt_SetTraceStatus

Upstream requirements: RS_LT_00004, RS_LT_00038

Γ

Service Name	Dlt_SetTraceStatus		
Syntax	Dlt_ApplicationIDT Dlt_ContextIDType	Std_ReturnType Dlt_SetTraceStatus (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, boolean newTraceStatus)	
Service ID [hex]	0x09		
Sync/Async	Synchronous		
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	appld ID of the SW-C		
	contextld	ID of the context	
	newTraceStatus	New trace status	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Trace status could not be changed	
Description	The service Dlt_SetTraceSt ContextID.	The service Dlt_SetTraceStatus sets the trace status for a specific tuple of ApplicationID and ContextID.	
Available via	Dlt.h	Dlt.h	

8.3.10 Dlt_GetLogInfo

[SWS_DIt_00732] Definition of API function DIt_GetLogInfo \lceil

Service Name	Dlt_GetLogInfo	
Syntax	<pre>Std_ReturnType Dlt_GetLogInfo (uint8 options, Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, uint8* status, Dlt_LogInfoType* logInfo)</pre>	
Service ID [hex]	0x0a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	options	Used to filter the response in respect to the ApplicationId, Context Id and Trace Status information
	appld	Representation of the ApplicationId
	contextId	Representation of the Contextld

Parameters (inout)	None	
Parameters (out)	status	-
	logInfo	Details about the returned Application IDs
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogInfo could not be returned
Description	Called to request information about registered ApplicationIds, their ContextIds and the corresponding log level.	
Available via	Dlt.h	

8.3.11 Dlt_GetDefaultLogLevel

[SWS_Dlt_00733] Definition of API function Dlt_GetDefaultLogLevel [

Service Name	Dlt_GetDefaultLogLevel		
Syntax		Std_ReturnType Dlt_GetDefaultLogLevel (Dlt_MessageLogLevelType* defaultLogLevel)	
Service ID [hex]	0x18		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	defaultLogLevel	Returns the stored LogLevel setting	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: The default LogLevel could not be returned	
Description	· 1	Returns the Default Log Level currently used by the Dlt module. The returned Log Level might differ from the one which is stored non volatile.	
Available via	Dlt.h		

I

[SWS_DIt_00734] \lceil A call to Dlt_GetDefaultLogLevel shall return with E_OK if the Dlt module provided the current value of the parameter DltDefaultLogLevel.

[SWS_DIt_00735] \lceil A call to Dlt_GetDefaultLogLevel shall return with E_NOT_-OK if the Dlt module cannot provide the current value of the parameter DltDefault-LogLevel.

8.3.12 Dlt StoreConfiguration

[SWS_DIt_00736] Definition of API function Dlt_StoreConfiguration [

Service Name	Dlt_StoreConfiguration	
Syntax	Std_ReturnType Dlt_StoreConfiguration (void)	
Service ID [hex]	0x1a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: The configuration could not be stored DLT_E_NOT_SUPPORTED: Service is not supported DLT_E_ERROR
Description	Copies the current Dlt configuration to NvRAM by calling NvM_WriteBlock(). No return value expected from NvM_WriteBlock()	
Available via	Dlt.h	

1

[SWS_Dlt_00737] [If the parameter DltGeneralNvRAMSupport is set to FALSE, a call to Dlt_StoreConfiguration shall return with DLT_E_NOT_SUPPORTED.]

[SWS_DIt_00729] [If the parameter DltGeneralNvRAMSupport is set to TRUE, a call to Dlt_StoreConfiguration shall return with DLT_E_ERROR in case the call to NvM_WriteBlock returned with E_NOT_OK.]

[SWS_Dlt_00738] [If the parameter DltGeneralNvRAMSupport is set to TRUE, a call to Dlt_StoreConfiguration shall return with E_OK in case the call to NvM_-WriteBlock returned with E_OK.|

8.3.13 Dlt ResetToFactoryDefault

[SWS_DIt_00739] Definition of API function DIt_ResetToFactoryDefault [

Service Name	Dlt_ResetToFactoryDefault
Syntax	<pre>Std_ReturnType Dlt_ResetToFactoryDefault (void)</pre>

 ∇

Service ID [hex]	0x06	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	
Description	The service Dlt_ResetToFactoryDefault sets the LogLevel and TraceStatus back to the persistently stored default values. If the feature NvMRAM support is enabled, all stored Dlt values in the NvM are deleted. No return value expected from NvM	
Available via	Dlt.h	

8.3.14 Dlt_SetMessageFiltering

[SWS_DIt_00770] Definition of API function DIt_SetMessageFiltering \lceil

Service Name	Dlt_SetMessageFiltering		
Syntax	<pre>Std_ReturnType Dlt_SetMessageFiltering (boolean status)</pre>		
Service ID [hex]	0x1b		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	status	TRUE: enable message filtering FALSE: disable message filtering	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Setting of message filtering failed	
Description	Switches on/off the message filtering functionality of the Dlt module. If disabled, all the messages will pass the filter.		
Available via	Dlt.h		

8.3.15 Dlt_SetDefaultLogLevel

[SWS_Dlt_00740] Definition of API function Dlt_SetDefaultLogLevel [

Service Name	Dlt_SetDefaultLogLevel		
Syntax	<pre>Std_ReturnType Dlt_SetDefaultLogLevel (Dlt_MessageLogLevelType newLogLevel)</pre>		
Service ID [hex]	0x11	0x11	
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	newLogLevel	sets the new filter value	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default LogLevel could not be set	
Description	Called to modify the pass through range for Log Messages for all not explicit set ContextIds.		
Available via	Dlt.h		

[SWS_DIt_00741] [If a call to Dlt_SetDefaultLogLevel successfully sets the requested DltDefaultLogLevel, it shall return with E_OK|

[SWS_DIt_00742] [If a call to Dlt_SetDefaultLogLevel could not set the requested DltDefaultLogLevel, it shall return with E_NOT_OK|

8.3.16 Dlt SetDefaultTraceStatus

[SWS_DIt_00743] Definition of API function Dlt_SetDefaultTraceStatus [

Service Name	Dlt_SetDefaultTraceStatus	
Syntax	<pre>Std_ReturnType Dlt_SetDefaultTraceStatus (boolean newTraceStatus)</pre>	
Service ID [hex]	0x12	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	newTraceStatus	enabling/disabling of Trace messages
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default Trace Status could not be set
Description	Called to enable or disable trace messages for all not explicitly set ContextIds.	

Available via	Dlt.h
---------------	-------

[SWS_DIt_00744] [If a call to Dlt_SetDefaultTraceStatus successfully sets the requested new DltDefaultTraceStatus, it shall return E_OK|

[SWS_DIt_00745] [If a call to Dlt_SetDefaultTraceStatus could not set the requested DltDefaultTraceStatus, it shall return with E_NOT_OK]

8.3.17 Dlt GetDefaultTraceStatus

[SWS_DIt_00746] Definition of API function Dlt_GetDefaultTraceStatus [

Service Name	Dlt_GetDefaultTraceStatus	Dlt_GetDefaultTraceStatus	
Syntax	<pre>Std_ReturnType Dlt_GetDefaultTraceStatus (boolean* traceStatus)</pre>		
Service ID [hex]	0x19		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	None		
Parameters (inout)	None		
Parameters (out)	traceStatus	current trace status (enabled/disabled)	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Default Trace Status could not be returned	
Description	Returns the current Trace Status of the addressed LogChannel.		
Available via	Dlt.h	Dlt.h	

1

[SWS_DIt_00747] [If a call to Dlt_GetDefaultTraceStatus could provide the current DltDefaultTraceStatus, it shall return with E_OK]

[SWS_DIt_00748] [If a call to Dlt_GetDefaultTraceStatus could not provide the DltDefaultTraceStatus, it shall return with E_NOT_OK|

8.3.18 Dlt_GetLogChannelNames

[SWS_DIt_00749] Definition of API function Dlt_GetLogChannelNames [

Service Name	Dlt_GetLogChannelNames		
Syntax	<pre>Std_ReturnType Dlt_GetLogChannelNames (uint8* numberOfLogChannels, Dlt_LogChannelNameInfoType logChannelNames)</pre>		
Service ID [hex]	0x17		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	None		
Parameters (inout)	numberOfLogChannels	Contains the number of requested LogChannels names. On Return it holds the number of configured LogChannels	
Parameters (out)	logChannelNames	Returns a list of configured LogChannel names. The size of the list is limited by MaxNumberOfChannels.	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogChannelNames could not be returned	
Description	The caller provides the number of logChannelNames to be returned. The function returns the requested amount of LogChannelNames and updates numberOfLogChannels as the outgoing information on how many LogChannels are actually configured.		
Available via	Dlt.h	Dlt.h	

8.3.19 Dlt_GetTraceStatus

[SWS_DIt_00750] Definition of API function DIt_GetTraceStatus [

Service Name	Dlt_GetTraceStatus	
Syntax	Std_ReturnType Dlt_GetTraceStatus (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, boolean* traceStatus)	
Service ID [hex]	0x1f	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	appld	ApplicationId
	contextId	ContextId
Parameters (inout)	None	
Parameters (out)	traceStatus	current Trace Status of the tuple ApplicationId/ContextId
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: TraceStatus could not be returned
Description	Returns the current Trace Status for a given tuple ApplicationId/ContextId.	
Available via	Dit.h	

8.3.20 Dlt_SetLogChannelAssignment

[SWS_Dlt_00751] Definition of API function Dlt_SetLogChannelAssignment [

Service Name	Dlt_SetLogChannelAssignr	nent	
Syntax	Std_ReturnType Dlt_SetLogChannelAssignment (Dlt_ApplicationIDType appId, Dlt_ContextIDType contextId, Dlt_LogChannelNameType logChannelName, Dlt_AssignmentOperation addRemoveOp)		
Service ID [hex]	0x20		
Sync/Async	Synchronous	Synchronous	
Reentrancy	Non Reentrant		
Parameters (in)	appld	ID of the addressed application / SW-C	
	contextId	ID of the addressed context	
	logChannelName Name of the addressed LogChannel		
Parameters (inout)	None	None	
Parameters (out)	None		
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogChannel assignment failed	
Description	Adds/removes the addressed tuple ApplicationId/ContextId to/from the addressed LogChannel.		
Available via	Dlt.h		

8.3.21 Dlt_SetLogChannelThreshold

[SWS_Dlt_00752] Definition of API function Dlt_SetLogChannelThreshold [

Service Name	Dlt_SetLogChannelThreshold	
Syntax	Std_ReturnType Dlt_SetLogChannelThreshold (Dlt_LogChannelNameType logChannelName, Dlt_MessageLogLevelType newThreshold, boolean newTraceStatus)	
Service ID [hex]	0x21	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different LogChannelNames	
Parameters (in)	logChannelName	Name of the addressed LogChannel
	newThreshold	Threshold for LogMessages
	newTraceStatus	TRUE: enable TraceMessages FALSE: disable TraceMessages
Parameters (inout)	None	
Parameters (out)	None	

Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: Setting of LogChannelThreshold failed
Description	Sets the filter threshold for the given LogChannel.	
Available via	Dlt.h	

١

8.3.22 Dlt_GetLogChannelThreshold

[SWS_DIt_00753] Definition of API function Dlt_GetLogChannelThreshold \lceil

Service Name	Dlt_GetLogChannelThresl	nold	
Syntax	Std_ReturnType Dlt_GetLogChannelThreshold (Dlt_LogChannelNameType logChannelName, Dlt_MessageLogLevelType* logChannelThreshold, boolean* traceStatus)		
Service ID [hex]	0x22	0x22	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Reentrant for different LogChannelNames		
Parameters (in)	logChannelName	Addressed LogChannel name	
Parameters (inout)	None		
Parameters (out)	logChannelThreshold	Current LogChannelThreshold	
	traceStatus	Current TraceStatus. TRUE: TraceMessages enabled. FALSE: TraceMessages disabled.	
Return value	Std_ReturnType	E_OK: No error occurred E_NOT_OK: LogChannelThreshold could not be returned	
Description	Returns the filter threshold	Returns the filter threshold for the given LogChannel.	
Available via	Dlt.h		

8.3.23 Dlt_SendLogMessageWithAttributes

[SWS_DIt_91011] Definition of API function DIt_SendLogMessageWithAttributes

Service Name	Dlt_SendLogMessageWith	Attributes	
Syntax	<pre>Std_ReturnType Dlt_SendLogMessageWithAttributes (Dlt_SessionIDType sessionId, const Dlt_MessageLogInfoType* logInfo, const uint8* logData, uint16 logDataLength, const Dlt_MessageAttributesType* attributes)</pre>		
Service ID [hex]	0x81		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number	
	logInfo	Structure containing the relevant information for filtering the message.	
	logData	Buffer containing the parameters to be logged. The contents of this pointer represents the payload of the Log Message to be sent.	
	logDataLength	Length of the data buffer logData.	
	attributes	Structure containing optional message attributes	
Parameters (inout)	None	None	
Parameters (out)	None	None	
Return value	Std_ReturnType	DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown. DLT_E_NOT_SUPPORTED: Operation/Command unsupported	
Description	The service represents the interface to be used by basic software modules or by software component to send Log Messages with attributes.		
Available via	Dlt.h		

ī

8.3.24 Dlt_SendTraceMessageWithAttributes

[SWS_DIt_91012] Definition of API function DIt_SendTraceMessageWithAttributes $\ \lceil$

Service Name	Dlt_SendTraceMessageWith	nAttributes
Syntax	Std_ReturnType Dlt_SendTraceMessageWithAttributes (Dlt_SessionIDType sessionId, const Dlt_MessageTraceInfoType* traceInfo, const uint8* traceData, uint16 traceDataLength, const Dlt_MessageAttributesType* attributes)	
Service ID [hex]	0x82	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	sessionId	For SW-C this is not visible (Port defined argument value), for BSW-modules it is the module number
	traceInfo	Structure containing the relevant information for filtering the message.
	traceData	Buffer containing the parameters to be traced. The contents of this pointer represents the payload of the Trace Message to be sent.
	traceDataLength	Length of the data buffer traceData.
	attributes	Structure containing optional message attributes
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	DLT_OK: The required operation succeeded. DLT_E_MSG_TOO_LARGE: The message is too large for all assigned LogChannels DLT_E_NO_BUFFER: The LogMessage could not be buffered at any assigned LogChannel DLT_E_UNKNOWN_SESSION_ID: The provided session id is unknown. DLT_E_NOT_SUPPORTED: Operation/Command unsupported
Description	The service represents the interface to be used by basic software modules or by software components to trace parameters, with attributes.	
Available via	Dlt.h	

8.4 Callback notifications

This is a list of functions provided for other modules.

8.4.1 Dlt_RxIndication

[SWS_DIt_00272] Definition of callback function Dlt_RxIndication [

Service Name	Dlt_RxIndication	
Syntax	<pre>void Dlt_RxIndication (PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>	
Service ID [hex]	0x42	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	RxPduld ID of the received PDU.	
	PduInfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of a received PDU from a lower layer communication interface module.	
Available via	Dlt.h	

8.4.2 Dlt_TriggerTransmit

[SWS_DIt_00754] Definition of callback function Dlt_TriggerTransmit [

Service Name	Dlt_TriggerTransmit	
Syntax	Std_ReturnType Dlt_TriggerTransmit (PduIdType TxPduId, PduInfoType* PduInfoPtr)	
Service ID [hex]	0x41	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	TxPduld ID of the SDU that is requested to be transmitted.	
Parameters (inout)	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.

Description	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.
Available via	Dlt.h

[SWS_DIt_00755] [If development error detection is enabled for this module, the module shall check all parameters for being valid. If the check fails, the function shall raise a development error and return.]

8.4.3 Dlt_TxConfirmation

[SWS_Dlt_00273] Definition of callback function Dlt_TxConfirmation [

Service Name	Dlt_TxConfirmation	
Syntax	<pre>void Dlt_TxConfirmation (PduIdType TxPduId, Std_ReturnType result)</pre>	
Service ID [hex]	0x40	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in)	TxPduld ID of the PDU that has been transmitted.	
	result E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.	
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.	
Available via	Dlt.h	

8.4.4 Dlt_TpTxConfirmation

[SWS_Dlt_00756] Definition of callback function Dlt_TpTxConfirmation [

Service Name	Dlt_TpTxConfirmation	
Syntax	<pre>void Dlt_TpTxConfirmation (PduIdType id, Std_ReturnType result)</pre>	
Service ID [hex]	0x48	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id Identification of the transmitted I-PDU.	
	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not.	
Available via	Dlt.h	

8.4.5 Dlt_CopyTxData

[SWS_Dlt_00516] Definition of callback function Dlt_CopyTxData

Upstream requirements: RS_LT_00034

Γ

Service Name	Dlt_CopyTxData	
Syntax	BufReq_ReturnType Dlt_CopyTxData (PduIdType id, const PduInfoType* info, const RetryInfoType* retry, PduLengthType* availableDataPtr)	
Service ID [hex]	0x43	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the transmitted I-PDU.

	info	Provides the destination buffer (SduDataPtr) and the number of bytes to be copied (SduLength). If not enough transmit data is available, no data is copied by the upper layer module and BUFREQ_E_BUSY is returned. The lower layer module may retry the call. An SduLength of 0 can be used to indicate state changes in the retry parameter or to query the current amount of available data in the upper layer module. In this case, the Sdu DataPtr may be a NULL_PTR.
	retry	This parameter is used to acknowledge transmitted data or to retransmit data after transmission problems.
		If the retry parameter is a NULL_PTR, it indicates that the transmit data can be removed from the buffer immediately after it has been copied. Otherwise, the retry parameter must point to a valid RetryInfoType element.
		If TpDataState indicates TP_CONFPENDING, the previously copied data must remain in the TP buffer to be available for error recovery. TP_DATACONF indicates that all data that has been copied before this call is confirmed and can be removed from the TP buffer. Data copied by this API call is excluded and will be confirmed later. TP_DATARETRY indicates that this API call shall copy previously copied data in order to recover from an error. In this case TxTpDataCnt specifies the offset in bytes from the current data copy position.
Parameters (inout)	None	
Parameters (out)	availableDataPtr	Indicates the remaining number of bytes that are available in the upper layer module's Tx buffer. availableDataPtr can be used by TP modules that support dynamic payload lengths (e.g. FrIsoTp) to determine the size of the following CFs.
Return value	BufReq_ReturnType	BUFREQ_OK: Data has been copied to the transmit buffer completely as requested. BUFREQ_E_BUSY: Request could not be fulfilled, because the required amount of Tx data is not available. The lower layer module may retry this call later on. No data has been copied. BUFREQ_E_NOT_OK: Data has not been copied. Request failed.
Description	This function is called to acquire the transmit data of an I-PDU segment (N-PDU). Each call to this function provides the next part of the I-PDU data unless retry->TpDataState is TP_DATARETRY. In this case the function restarts to copy the data beginning at the offset from the current position indicated by retry->TxTpDataCnt. The size of the remaining data is written to the position indicated by availableDataPtr.	
Available via	Dlt.h	

8.4.6 Dlt_StartOfReception

[SWS_DIt_91006] Definition of callback function Dlt_StartOfReception [

Service Name	Dlt_StartOfReception	
Syntax	BufReq_ReturnType Dlt_StartOfReception (PduIdType id, const PduInfoType* info, PduLengthType TpSduLength, PduLengthType* bufferSizePtr)	
Service ID [hex]	0x46	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the I-PDU.
	info	Pointer to a PduInfoType structure containing the payload data (without protocol information) and payload length of the first frame or single frame of a transport protocol I-PDU reception, and the MetaData related to this PDU. If neither first/single frame data nor MetaData are available, this parameter is set to NULL_PTR.
	TpSduLength	Total length of the N-SDU to be received.
Parameters (inout)	None	
Parameters (out)	bufferSizePtr	Available receive buffer in the receiving module. This parameter will be used to compute the Block Size (BS) in the transport protocol module.
Return value	BufReq_ReturnType	BUFREQ_OK: Connection has been accepted. bufferSizePtr indicates the available receive buffer; reception is continued. If no buffer of the requested size is available, a receive buffer size of 0 shall be indicated by bufferSizePtr. BUFREQ_E_NOT_OK: Connection has been rejected; reception is aborted. bufferSizePtr remains unchanged. BUFREQ_E_OVFL: No buffer of the required length can be provided; reception is aborted. bufferSizePtr remains unchanged.
Description	This function is called at the start of receiving an N-SDU. The N-SDU might be fragmented into multiple N-PDUs (FF with one or more following CFs) or might consist of a single N-PDU (SF). The service shall provide the currently available maximum buffer size when invoked with TpSdu Length equal to 0.	
Available via	Dlt.h	

8.4.7 Dlt_TpRxIndication

[SWS_Dlt_91007] Definition of callback function Dlt_TpRxIndication [

Service Name	Dlt_TpRxIndication
Syntax	<pre>void Dlt_TpRxIndication (PduIdType id, Std_ReturnType result)</pre>

Service ID [hex]	0x45	0x45	
Sync/Async	Synchronous	Synchronous	
Reentrancy	Reentrant	Reentrant	
Parameters (in)	id	id Identification of the received I-PDU.	
	result	E_OK: The PDU was received. E_NOT_OK: Reception of the PDU failed.	
Parameters (inout)	None	None	
Parameters (out)	None		
Return value	None	None	
Description		Called after an I-PDU has been received via the TP API, the result indicates whether the transmission was successful or not.	
Available via	Dlt.h	Dit.h	

1

8.4.8 Dlt_CopyRxData

[SWS_DIt_91008] Definition of callback function Dlt_CopyRxData [

Service Name	Dlt_CopyRxData	
Syntax	BufReq_ReturnType Dlt_CopyRxData (PduIdType id, const PduInfoType* info, PduLengthType* bufferSizePtr)	
Service ID [hex]	0x44	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	id	Identification of the received I-PDU.
	info	Provides the source buffer (SduDataPtr) and the number of bytes to be copied (SduLength). An SduLength of 0 can be used to query the current amount of available buffer in the upper layer module. In this case, the SduDataPtr may be a NULL_PTR.
Parameters (inout)	None	
Parameters (out)	bufferSizePtr	Available receive buffer after data has been copied.
Return value	BufReq_ReturnType	BUFREQ_OK: Data copied successfully BUFREQ_E_NOT_OK: Data was not copied because an error occurred.
Description	This function is called to provide the received data of an I-PDU segment (N-PDU) to the upper layer. Each call to this function provides the next part of the I-PDU data. The size of the remaining buffer is written to the position indicated by bufferSizePtr.	
Available via	Dlt.h	

8.5 Scheduled functions

8.5.1 Dlt_TxFunction

[SWS Dlt 91005] Definition of scheduled function Dlt TxFunction

Service Name	Dlt_TxFunction	
Syntax	void Dlt_TxFunction (
	void)	
Service ID [hex]	0x80	
Description	-	
Available via	SchM_Dlt.h	

1

[SWS_DIt_00758] [If the configuration parameter DltGeneralTrafficShaping—Support is set to TRUE, the Dlt messages shall be transmitted with the maximum bandwidth per LogChannel as configured using the parameter DltLogChannel—TrafficShapingBandwidth.|

[SWS_DIt_00759] [If the configuration parameter DltGeneralTrafficShaping—Support is set to FALSE, all buffered Dlt messages shall be transmitted at once.]

[SWS_DIt_00760] [The Dlt_TxFunction shall check the status of the flag, which indicates that a BufferOverflow occurred:

- If a buffer overflow occurred, the Dlt command BufferOverflowNotification shall be sent only once, until the overflow flag is cleared again.
- After a time interval given by the parameter DltLogChannelBufferOver-flowTimer, the buffer overflow flag shall be cleared.

This shall be done for every configured LogChannel separately.

[SWS_DIt_00761] [If a DIt message could not be sent, every time the Dlt_TxFunction is called, it shall retry to send this message one time. This shall be done for every message separately and taking care to not exceed the amount of retries given by DltLogChannelMaxNumOfRetries.]

8.6 Expected interfaces

In this section all external interfaces required from other modules are listed.

8.6.1 Mandatory interfaces

This section defines all external interfaces, which are required to fulfill the core functionality of the module.

The module relies on the following interfaces:

[SWS_DIt_00762] Definition of mandatory interfaces required by module DIt [

API Function	Header File	Description
PduR_DltTransmit	PduR_Dlt.h	Requests transmission of a PDU.

8.6.2 Optional interfaces

This section defines all external interfaces, which are required to fulfill an optional functionality of the module.

The module relies on the following optional interfaces:

[SWS_DIt_00763] Definition of optional interfaces requested by module DIt [

API Function	Header File	Description
Det_ReportError	Det.h	Service to report development errors.
Gpt_EnableNotification	Gpt.h	Enables the interrupt notification for a channel (relevant in normal mode).
Gpt_StartTimer	Gpt.h	Starts a timer channel.
NvM_EraseNvBlock	NvM.h	Service to erase a NV block.
NvM_ReadBlock	NvM.h	Service to copy the data of the NV block to its corresponding RAM block.
NvM_WriteBlock	NvM.h	Service to copy the data of the RAM block to its corresponding NV block.
StbM_GetCurrentTime	StbM.h	Returns a time tuple (Local time, Global time and Timebase status) and user data details Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).

8.6.3 Configurable interfaces

This section defines all configurable external interfaces.

[SWS_Dlt_00259] Definition of configurable interface Dlt_InjectCall_<SESSION>

Service Name	Dlt_InjectCall_ <session></session>		
Syntax	Dlt_ApplicationIDT	uint32 dataLength,	
Sync/Async	Asynchronous		
Reentrancy	Non Reentrant	Non Reentrant	
Parameters (in)	appld	the Application ID	
	contextId	the Context ID	
	serviceld	the service ID for the injection (user defined)	
	dataLength	dataLength length of the data puffer provided data pointer to data puffer with data belonging to the injection (service ID). The contents of the data is user defined	
	data		
Parameters (inout)	None		
Parameters (out)	None	None	
Return value	None	None	
Description		Callback is called by Dlt to inject a function call in the SW-C. The behaviour trigged by this function should depend on the service_id also the interpretation of the user data. Both are specific to the application.	
Available via	Dlt.h		

L

8.7 Service Interfaces

8.7.1 Client-Server-Interfaces

8.7.1.1 DltControlService

[SWS_DIt_00772] Definition of ClientServerInterface DltControlService

Name	DltControl	DltControlService		
Comment	-			
IsService	true			
Variation	-	-		
Possible Errors	0	E_OK	Operation successful	
	7	DLT_E_NOT_ SUPPORTED	Operation/Command unsupported	
	9	DLT_E_ERROR	Operation/Command unsuccessful	

Operation	GetDefaultLogLevel	
Comment	_	
Mapped to API	Dlt_GetDefault	LogLevel
Variation	_	
Parameters	defaultLoglevel	
	Туре	Dlt_MessageLogLevelType
	Direction OUT	
	Comment Returns the stored LogLevel setting	
	Variation	-
Possible Errors	E_OK DLT_E_ERROR	

Operation	GetDefaultTra	GetDefaultTraceStatus	
Comment	_		
Mapped to API	Dlt_GetDefaul	tTraceStatus	
Variation	_		
Parameters	traceStatus	traceStatus	
	Туре	boolean	
	Direction	OUT	
	Comment	current trace status (enabled/disabled)	
	Variation	-	
Possible Errors	E_OK DLT_E_ERRO	DR .	

Operation	GetLogChannelNames	
Comment	_	
Mapped to API	Dlt_GetLogCha	annelNames
Variation	_	
Parameters	numberOfLog(Channels
	Туре	uint8
	Direction	INOUT
	Comment	Contains the number of requested LogChannels names. On Return it holds the number of configured LogChannels
	Variation	-
	logChannelNames	
	Туре	Dlt_LogChannelNameInfoType
	Direction	OUT
	Comment	Returns a list of configured LogChannel names. The size of the list is limited by MaxNumberOfChannels.
	Variation	-
Possible Errors	E_OK DLT_E_ERRO	R

Operation	GetLogChannelThreshold		
Comment	-		
Mapped to API	Dlt_GetLogChannelThreshold		
Variation	-		
Parameters	logChannelName		

	Туре	Dlt_LogChannelNameType
	Direction	IN
	Comment	Addressed LogChannel name
	Variation	-
	logChannelThr	eshold
	Туре	Dlt_MessageLogLevelType
	Direction	OUT
	Comment	Current LogChannelThreshold
	Variation	-
	traceStatusPtr	
	Туре	boolean
	Direction	OUT
	Comment	Current TraceStatus. TRUE: TraceMessages enabled. FALSE: TraceMessages disabled.
	Variation	-
Possible Errors	E_OK DLT_E_ERRO	R

Operation	GetLogInfo	
Comment	-	
Mapped to API	Dlt_GetLogInf	0
Variation	_	
	options	
Parameters	Туре	uint8
	Direction	IN
	Comment	Used to filter the response in respect to the ApplicationId, ContextId and Trace Status information
	Variation	-
	appld	
	Туре	Dlt_ApplicationIDType
	Direction	IN
	Comment	Representation of the ApplicationId
	Variation	-
	contextId	
	Туре	Dlt_ContextIDType
	Direction	IN
	Comment	Representation of the Contextld
	Variation	-
	status	
	Туре	uint8
	Direction	OUT
	Comment	-
	Variation	_
	logInfo	
	Туре	Dlt_LogInfoType
	Direction	OUT
	Comment	Details about the returned Application IDs

	Variation	1
Possible Errors	E_OK DLT E ERRO	R

Operation	GetTraceStatus	
Comment	_	
Mapped to API	Dlt_GetTraceS	tatus
Variation	_	
variation	appld	
Parameters		
	Туре	Dlt_ApplicationIDType
	Direction	IN
	Comment	ApplicationId
	Variation	-
	contextId	
	Туре	Dlt_ContextIDType
	Direction	IN
	Comment	Contextld
	Variation	_
	traceStatus	
	Туре	boolean
	Direction	OUT
	Comment	current Trace Status of the tuple ApplicationId/ContextId
	Variation	-
Possible Errors	E_OK DLT_E_ERRO	R

Operation	ResetToFactoryDefault
Comment	-
Mapped to API	Dlt_ResetToFactoryDefault
Variation	-
Possible Errors	E_OK DLT_E_ERROR

Operation	SetDefaultLog	SetDefaultLogLevel	
Comment	_		
Mapped to API	Dlt_SetDefaul	tLogLevel	
Variation	-	_	
Parameters	newDefaultLo	newDefaultLogLevel	
	Туре	Dlt_MessageLogLevelType	
	Direction	Direction IN	
	Comment	Comment sets the new filter value	
	Variation	-	
Possible Errors	E_OK DLT_E_ERRO	DR .	

Operation	SetDefaultTraceStatus		
Comment	-		
Mapped to API	Dlt_SetDefaultTraceStatus		

Variation	-		
Parameters	newTraceStatus		
	Туре	Type boolean	
	Direction IN		
	Comment enabling/disabling of Trace messages		
	Variation	Variation –	
Possible Errors	E_OK DLT_E_ERRO	R	

Operation	SetLogChann	SetLogChannelAssignment			
Comment	_	_			
Mapped to API	Dlt_SetLogCh	Dlt_SetLogChannelAssignment			
Variation					
	appld				
Parameters	Туре	Dlt_ApplicationIDType			
	Direction	IN			
	Comment	ID of the addressed application / SW-C			
	Variation	-			
	contextId				
	Туре	Type Dlt_ContextIDType			
	Direction	Direction IN			
	Comment	Comment ID of the addressed context			
	Variation				
	logChannelNa	logChannelName			
	Туре	Type Dlt_LogChannelNameType			
	Direction	Direction IN			
	Comment	Comment Name of the addressed LogChannel			
	Variation	Variation –			
	addRemoveO	addRemoveOp			
	Туре	Type Dlt_AssignmentOperation			
	Direction	Pirection IN			
	Comment	Operation to add/remove the addressed tuple ApplicationId/ContextId to/from the addressed LogChannel			
	Variation	-			
Possible Errors	E_OK DLT_E_ERRO	DR			

Operation	SetLogChannelThreshold			
Comment	-			
Mapped to API	Dlt_SetLogCha	annelThreshold		
Variation	_	-		
Parameters	logChannelName			
	Туре	Type Dlt_LogChannelNameType		
	Direction	Direction IN		
	Comment Name of the addressed LogChannel			
	Variation	Variation –		
	newLogLevelT	hreshold		

	Туре	Dlt_MessageLogLevelType
	Direction	IN
	Comment Threshold for LogMessages	
	Variation –	
	newTraceStatus	
	Type boolean	
	Direction IN	
	Comment	TRUE: enable TraceMessages FALSE: disable TraceMessages
	Variation	-
Possible Errors	E_OK DLT_E_ERRO	R

Operation	SetLogLevel			
Comment	-			
Mapped to API	Dlt_SetLogLev	el		
Variation	_			
Parameters	appld			
raiameters	Туре	Dlt_ApplicationIDType		
	Direction	IN		
	Comment	ID of the SW-C		
	Variation –			
	contextld			
	Type Dlt_ContextIDType			
	Direction IN			
	Comment ID of the context			
	Variation –			
	newLogLevel			
	Type Dlt_MessageLogLevelType			
	Direction IN			
	Comment new log level to set			
	Variation –			
Possible Errors	E_OK DLT_E_ERRO	R		

Operation	SetMessageFiltering		
Comment	-		
Mapped to API	Dlt_SetMessag	geFiltering	
Variation	-		
Parameters	status		
	Type boolean		
	Direction IN		
	Comment TRUE: enable message filtering FALSE: disable message filtering		
	Variation –		
Possible Errors	E_OK DLT_E_ERRO	R	

Operation	SetTraceStatus		
Comment	-		
Mapped to API	Dlt_SetTraceSt	atus	
Variation	-		
Parameters	appld		
raiailieleis	Туре	Dlt_ApplicationIDType	
	Direction	IN	
	Comment	ID of the SW-C	
	Variation –		
	contextld		
	Type Dlt_ContextIDType		
	Direction IN		
	Comment ID of the context		
	Variation –		
	newTraceStatus		
	Type boolean		
	Direction IN		
	Comment New trace status		
	Variation	-	
Possible Errors	E_OK DLT_E_ERROR		

Operation	StoreConfiguration
Comment	-
Mapped to API	Dlt_StoreConfiguration
Variation	-
Possible Errors	E_OK DLT_E_NOT_SUPPORTED DLT_E_ERROR

1

8.7.1.2 InjectionCallback

[SWS_DIt_00498] Definition of ClientServerInterface InjectionCallback \lceil

Name	InjectionC	InjectionCallback			
Comment	_	-			
IsService	true	true			
Variation	_	-			
Possible Errors	0	0 E_OK Operation successful			
	1	1 E_NOT_OK Operation failed			

Operation	InjectCall	
Comment	-	
Mapped to API	Dlt_InjectCall_ <session></session>	
Variation	_	
	appld	
Parameters	Туре	Dlt_ApplicationIDType
	Direction	IN
	Comment	_
	Variation	_
	contextId	
	Туре	Dlt_ContextIDType
	Direction	IN
	Comment	-

8.7.2 Implementation Data Types

8.7.2.1 Dlt_ApplicationIDType

[SWS_Dlt_00226] Definition of ImplementationDataType Dlt_ApplicationIDType [

Name	Dlt_ApplicationIDType			
Kind	Туре			
Derived from	uint32			
Range	0x0000000-0xFFFFFFF – – –			
Description	This type describes the ApplicationId. 0x00000000 means the so-called wildcard.			
Variation	_			
Available via	Rte_Dlt_Type.h			

١

8.7.2.2 Dlt_ContextIDType

[SWS_Dlt_00227] Definition of ImplementationDataType Dlt_ContextIDType [

Name	Dlt_ContextIDType			
Kind	Туре			
Derived from	uint32			
Range	0x0000000-0xFFFFFFF			
Description	This type describes the ContextId. 0x00000000 means the so-called wildcard.			
Variation	-			
Available via	Rte_Dlt_Type.h			

8.7.2.3 Dlt_SessionIDType

[SWS_Dlt_00225] Definition of ImplementationDataType Dlt_SessionIDType [

Name	Dlt_SessionIDType
Kind	Туре
Derived from	uint32
Description	This type identifies the session.
Variation	-
Available via	Rte_Dlt_Type.h

8.7.2.4 Dlt_LogInfoType

[SWS_Dlt_91002] Definition of ImplementationDataType Dlt_LogInfoType [

Name	Dlt_LogInfoType			
Kind	Structure			
Elements	appldCount			
	Туре	uint16		
	Comment Number of Applds			
	appldInfo			
	Type Array of Dlt_ApplicationIdInfoType			
	Size			
	Comment	Details of Application		
Description	_			
Variation	_			
Available via	Rte_Dlt_Type.h			

8.7.2.5 Dlt_ContextIdInfoType

[SWS_Dlt_91003] Definition of ImplementationDataType Dlt_ContextIdInfoType [

Name	Dlt_ContextIdInfoType		
Kind	Structure		
Floresento	contextld		
Elements	Туре	Dlt_ContextIDType	
	Comment	the ContextId	
	logLevel		
	Туре	Dlt_MessageLogLevelType	
	Comment	the log message filter level	
	traceStatus		
	Туре	uint8	
	Comment	0: off 1: on	
	contextDescLen		
	Type uint8		
	Comment Length of Context Description		
	contextDesc		
	Type Array of uint8		
	Size		
	Comment	Context Description	
Description	Context Information		
Variation	_		

Available via	Rte_Dlt_Type.h

1

8.7.2.6 Dlt_ApplicationIdInfoType

[SWS_DIt_91004] Definition of ImplementationDataType DIt_ApplicationIdInfo Type \lceil

Name	Dlt_ApplicationIdInfoType		
Kind	Structure		
Elements	appld		
Elements	Туре	Dlt_ApplicationIDType	
	Comment	Application ID	
	contextIdCount		
	Туре	uint16	
	Comment	Length of contextInfoList	
	contextInfoList		
	Туре	Array of Dlt_ContextIdInfoType	
	Size		
	Comment	List of Context information	
	appDescLen		
	Туре	uint8	
	Comment Length of Application Description		
	appDesc		
	Type Array of uint8 Size Comment Application Description		
Description	Information about Applications		
Variation	-		
Available via	Rte_Dlt_Type.h		

8.7.2.7 Dlt_MessageOptionsType

[SWS_DIt_00229] Definition of ImplementationDataType DIt_MessageOptions Type \lceil

Name	Dlt_MessageOptionsTy	Dlt_MessageOptionsType			
Kind	Туре				
Derived from	uint8	uint8			
Range	verbose_mode	verbose_mode - Bit 0: If set Verbose mode is used			
	message_type	message_type — Bit 1-3 Dlt_MessageTypeType: determines type of msg (log,trace,)			
Description	Bitfield	Bitfield			
Variation	-				
Available via	Rte_Dlt_Type.h				

8.7.2.8 Dlt_MessageLogInfoType

[SWS_Dlt_00236] Definition of ImplementationDataType Dlt_MessageLogInfo Type \lceil

Name	Dlt_MessageLogInfoT	Dlt_MessageLogInfoType		
Kind	Structure			
Elements	argCount			
Elements	Туре	Dlt_MessageArgumentCount		
	Comment	-		
	logLevel			
	Туре	Dlt_MessageLogLevelType		
	Comment	-		
	options	options		
	Туре	Dlt_MessageOptionsType

	Туре	Dlt_ContextIDType		
	Comment	-		
	appld			
	Туре	Type Dlt_ApplicationIDType		
	Comment	-		
Description				
Variation	_			
Available via	Rte_Dlt_Type.h			

8.7.2.9 Dlt_MessageLogLevelType

[SWS_DIt_00230] Definition of ImplementationDataType DIt_MessageLogLevel Type \lceil

Name	Dlt_MessageLogLevelType			
Kind	Туре			
Derived from	uint8			
Range	DLT_LOG_OFF	0x00	Turn off logging	
	DLT_LOG_FATAL	0x01	Fatal system error	
	DLT_LOG_ERROR	0x02	Errors occurring in a SW-C with impact to correct functionality	
	DLT_LOG_WARN	0x03	Log messages where a incorrect behavior can not be ensured	
	DLT_LOG_INFO	0x04	Log messages providing information for better understanding of the internal behavior of a software	
	DLT_LOG_DEBUG	0x05	Log messages, which are usable only for debugging of a software	
	DLT_LOG_VERBOSE	0x06	Log messages with the highest communicative level, here all possible states, information and everything else can be logged	
Description	This type describes the log level for each log message.			
Variation	-			
Available via	Rte_Dlt_Type.h			

8.7.2.10 Dlt_MessageTraceType

[SWS_Dlt_00231] Definition of ImplementationDataType Dlt_MessageTraceType

Name	Dlt_MessageTraceType				
Kind	Туре				
Derived from	uint8				
Range	DLT_TRACE_VARIABLE 0x01 For tracing the value of a variable				
	DLT_TRACE_FUNCTION_ IN	0x02	For tracing the calling of a function		
	DLT_TRACE_FUNCTION_ OUT	0x03	For tracing the returning of a function		
	DLT_TRACE_STATE	0x04	For tracing a state of a state machine		
	DLT_TRACE_VFB	0x05	For tracing RTE Events		
Description	This type describes labels for	trace messages.	This type describes labels for trace messages.		

Variation	-
Available via	Rte_Dlt_Type.h

8.7.2.11 Dlt_MessageArgumentCount

[SWS_DIt_00235] Definition of ImplementationDataType DIt_MessageArgument Count \lceil

Name	Dlt_MessageArgumentCount
Kind	Туре
Derived from	uint16
Description	The implementation shall mask out the upper 8 bits of the value, and use only the lower 8 bits.
Variation	-
Available via	Rte_Dlt_Type.h

Ī

8.7.2.12 Dlt_MessageTraceInfoType

[SWS_Dlt_00237] Definition of ImplementationDataType Dlt_MessageTraceInfo Type \lceil

Name	Dlt_MessageTrace	Dlt_MessageTraceInfoType		
Kind	Structure	Structure		
Elements	traceInfo			
Liements	Туре	Dlt_MessageTraceType		
	Comment	-		
	options			
	Туре	Type Dlt_MessageOptionsType		
	Comment	Comment -		
	contextld	contextld		
	Туре	Dlt_ContextIDType		
	Comment	Comment -		
	appld			
	Туре	Type DIt_ApplicationIDType		
	Comment	-		
Description	_			
Variation	_			

Available via	Rte_Dlt_Type.h

8.7.2.13 Dlt_LogChannelNameInfoType

[SWS_DIt_91013] Definition of ImplementationDataType DIt_LogChannelName InfoType \lceil

Name	Dlt_LogChannelNameInfoType		
Kind	Array Element type Dit_LogChannelNameType		
Size	MaxNumberOfChannels Elements		
Description	This type describes a list of LogChannel names.		
Variation	-		
Available via	Rte_Dlt_Type.h		

Ī

[SWS_Dlt_00232] Definition of ImplementationDataType Dlt_LogChannelName Type \lceil

Name	Dlt_LogChannelNameType		
Kind	Array Element type uint8		
Size	4 Elements		
Description	This type describes the LogChannel name.		
Variation	-		
Available via	Rte_Dlt_Type.h		

8.7.2.14 Dlt_AssignmentOperation

[SWS_Dlt_00730] Definition of ImplementationDataType Dlt_AssignmentOperation \lceil

Name	Dlt_AssignmentOperation		
Kind	Туре		
Derived from	uint8		
Range	DLT_ASSIGN_REMOVE	0x00	Removing a LogChannel assignment

 ∇

	DLT_ASSIGN_ADD	0x01	Adding a LogChannel assignment
Description	Adding or removing a LogCha	nnel assignment for the given tup	ole of ApplicationId/ContextId.
Variation	-		
Available via	Rte_Dlt_Type.h		

8.7.2.15 Dlt_MessageAttributesType

[SWS_DIt_91010] Definition of ImplementationDataType Dlt_MessageAttributes Type \lceil

Name	Dlt_MessageAttribu	Dlt_MessageAttributesType	
Kind	Structure		
Elements	withPrivacyLevel		
	Туре	boolean	
	Comment	-	
	privacyLevel	privacyLevel	
	Туре	Type uint8	
	Comment	-	
	messageTags		
	Туре	const char*	
	Comment	-	
Description	-	_	
Variation	_	-	
Available via	Rte_Dlt_Type.h	Rte_Dlt_Type.h

8.7.3 Ports

8.7.3.1 Dlt_ControlService

[SWS_DIt_00499] Definition of Port ControlService provided by module DIt [

Name	ControlService			
Kind	ProvidedPort	ProvidedPort Interface DltControlService		
Description	Through this port SW-Cs can control log settings and other configurationitems of DLT.			
Variation	_			

ı

8.7.3.2 Dlt_InjectCallback_{SW-C}

[SWS_DIt_00778] Definition of Port InjectCallback_{SW-C} required by module DIt \lceil

Name	InjectCallback_{SW-C}			
Kind	RequiredPort	RequiredPort Interface InjectionCallback		
Description	Callback Port to registered Application, which processes Injection.			
Variation	SW-C = {ecuc(Dlt/DltSwc.SHORT-NAME)}			

Ī

8.7.3.3 Dlt SessionControlCallback {SW-C}

[SWS_Dlt_00779] Definition of Port SessionControlCallback_{SW-C} required by module Dlt \lceil

Name	SessionControlCallback_{SW-C}						
Kind	RequiredPort	RequiredPort Interface LogTraceSessionControl					
Description	Port used by Dlt to notify registered SW-C about LogLevel/TraceLevel Changes.						
Variation	SW-C = {ecuc(Dlt/[SW-C = {ecuc(Dit/DitSwc.SHORT-NAME)}					

8.7.3.4 Dlt SwcMessageService {SW-C}

[SWS_DIt_91001] Definition of Port SwcMessageService_{SW-C} provided by module DIt \lceil

Name	SwcMessageService_{SW-C}						
Kind	ProvidedPort	Interface DltSwcMessageService					
Description	Through this port S messages.	SW-Cs can register/unregister their contexts and send out log and trace					
Port Defined	Туре	Dlt_SessionIDType					
Argument Value(s)	Value	{ecuc(Dlt/DltSwc/DltSwcSessionId.value)}					
Variation	SW-C = {ecuc(Dit/DitSwc.SHORT-NAME)}

10 Configuration specification

Chapter 10.1 specifies the structure (containers) and the parameters of the module Dlt.

Chapter 10.2 specifies published information of the module Dlt.

10.1 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

10.1.1 DIt

[ECUC DIt 00800] Definition of EcucModuleDef DIt

Module Name	Dit	
Description	Configuration of the Dlt (Log&Trace) module.	
Post-Build Variant Support	true	
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE	

Included Containers					
Container Name	Container Name Multiplicity Scope / Dependency				
DltConfigSet	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.			
DltGeneral	1	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.			
DitSwc	0*	Contains necessary configuration parameters of the AUTOSAR Dlt module to interact with SWCs.			

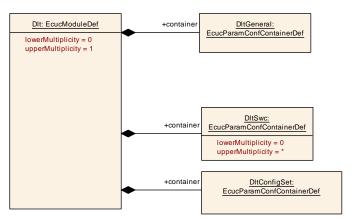

Figure 10.1: Dlt

10.1.2 DltGeneral

[ECUC_Dlt_00809] Definition of EcucParamConfContainerDef DltGeneral

Container Name	DltGeneral
Parent Container	Dit
Description	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.
Configuration Parameters	

Included Parameters				
Parameter Name	Multiplicity	ECUC ID		
DltGeneralDevErrorDetect	1	[ECUC_Dlt_00840]		
DltGeneralInjectionSupport	1	[ECUC_Dlt_00847]		
DltGeneralNvRAMSupport	1	[ECUC_Dlt_00915]		
DltGeneralRegisterContextNotification	1	[ECUC_Dlt_00846]		
DltGeneralRxDataPathSupport	1	[ECUC_Dlt_00848]		
DltGeneralStartUpDelayTimer	01	[ECUC_Dlt_00897]		
DltGeneralTimeStampSupport	1	[ECUC_Dlt_00850]		
DltGeneralTrafficShapingSupport	1	[ECUC_Dlt_00849]		
DltGeneralVersionInfoApi	01	[ECUC_Dlt_00844]		
DltMaxNumberOfChannels	1	[ECUC_Dlt_00918]		
DltProtocolVersion	01	[ECUC_Dlt_00917]		
DltGeneralGptChannelRef	01	[ECUC_Dlt_00905]		
DltGeneralNvRamRef	01	[ECUC_Dlt_00845]		
DltGeneralStbMTimeBaseRef	01	[ECUC_Dlt_00914]		

No Included Containers

[ECUC_DIt_00840] Definition of EcucBooleanParamDef DltGeneralDevErrorDetect \lceil

Parameter Name	DltGeneralDevErrorDetect		
Parent Container	DltGeneral		
Description	If the Default Error Tracer (Det) shall be used, this parameter shall be set to TRUE. Otherwise, it shall be set to FALSE.		
Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value	-		
Post-Build Variant Value	false

	Post-build time	ı	
Scope / Dependency	scope: local		

-

[ECUC_DIt_00846] Definition of EcucBooleanParamDef DltGeneralRegisterContextNotification \lceil

Parameter Name	DltGeneralRegisterContextNotification			
Parent Container	DltGeneral	DltGeneral		
Description	If this parameter is set to TRUE, a Dlt Control Message is sent every time a SWC registeres and/or de-registers at/from the Dlt Module. Else, this notification is not sent.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

1

[ECUC_Dlt_00848] Definition of EcucBooleanParamDef DltGeneralRxDataPath Support \lceil

Parameter Name	DitGeneralRxDataPathSupport			
Parent Container	DltGeneral	DltGeneral		
Description	Enables or disables the Rx Data Path to control the Dlt module.			
Multiplicity	1	1		
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			
	dependency: At least one RxPdu needs to be configured if DltGeneralRxDataPath Support = TRUE			

[ECUC_DIt_00897] Definition of EcucFloatParamDef DltGeneralStartUpDelay Timer \lceil

Parameter Name	DltGeneralStartUpDelayTimer			
Parent Container	DltGeneral			
Description	Configurable delay in s of starting the transmission of Log and Trace messages after the Dlt module has been initialized.			
Multiplicity	01			
Туре	EcucFloatParamDef			
Range	[0.001 10]	[0.001 10]		
Default value	_	-

Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

[ECUC_Dlt_00850] Definition of EcucBooleanParamDef DltGeneralTimeStamp Support \lceil

Parameter Name	DltGeneralTimeStampSupport			
Parent Container	DltGeneral	DltGeneral		
Description	If a Time Stamp shall be added to the Dlt messages, this configuration parameter shall be set to TRUE. Otherwise, it shall be set to FALSE.			
Multiplicity	1			
Туре	EcucBooleanParamDef	EcucBooleanParamDef		
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

[ECUC_Dlt_00849] Definition of EcucBooleanParamDef DltGeneralTrafficShapingSupport $\ \lceil$

Parameter Name	DltGeneralTrafficShapingSupport			
Parent Container	DltGeneral			
Description	Enables or disables the TrafficShaping feature to limit the maximum bandwidth for Dlt messages. If enabled, the maximum bandwidth can be configured per LogChannel.			

Multiplicity	1		
Туре	EcucBooleanParamDef		
Default value	true		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	_	
	Post-build time	_	
Scope / Dependency	scope: local		

[ECUC_DIt_00844] Definition of EcucBooleanParamDef DItGeneralVersionInfo Api \lceil

Parameter Name	DltGeneralVersionInfoApi			
Parent Container	DltGeneral			
Description	Pre-processor switch for enabling	Version In	fo API support.	
	True: version information API activated			
	False: version information API deactivated			
Multiplicity	01			
Туре	EcucBooleanParamDef	EcucBooleanParamDef		
Default value	-			
Post-Build Variant Multiplicity	false			
Post-Build Variant Value	false			
Multiplicity Configuration Class	Pre-compile time	Pre-compile time X All Variants

Scope / Dependency	scope: local			

١

[ECUC_DIt_00918] Definition of EcucIntegerParamDef DItMaxNumberOfChannels \lceil

Parameter Name	DltMaxNumberOfChannels		
Parent Container	DltGeneral		
Description	Maximum number of log channels. This value is used to determine the size of arrays of log channel names in the DLT API.		
Multiplicity	1		
Туре	EcucIntegerParamDef		
Range	1 65535		
Default value	-		
Post-Build Variant Value	false		

Value Configuration Class	Pre-compile time	Х	All Variants
	Link time	_	
	Post-build time	_	
Scope / Dependency	scope: local		

[ECUC_DIt_00917] Definition of EcucIntegerParamDef DltProtocolVersion [

Parameter Name	DltProtocolVersion			
Parent Container	DltGeneral			
Description	Selects the DLT protocol version to be used by Dlt module. Currently the versions 1 and 2 are supported.			
Multiplicity	01			
Туре	EcucIntegerParamDef			
Range	1 255			
Default value	1	1		
Post-Build Variant Multiplicity	false			
Post-Build Variant Value	false			
Multiplicity Configuration Class	Pre-compile time X All Variants

Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time –			
Scope / Dependency	scope: local			

1

[ECUC_DIt_00905] Definition of EcucReferenceDef DltGeneralGptChannelRef \lceil

Parameter Name	DltGeneralGptChannelRef			
Parent Container	DltGeneral			
Description	If TimeStampSupport is used the Dlt module shall fetch the time from the Gpt module by calling Gpt_GetTimeElapsed with the here referenced GptChannel. The tick duration can be deduced from the GptChannelTickFrequency parameter of the Gpt ChannelConfiguration container. This is necessary to calculate the microsecond resolution timestamp output in the Dlt message.			
	A GPT timer shall be used which starts with value 0 at ECU start-up according to the PRS Dlt Protocol Specification.			
Multiplicity	01			
Туре	Symbolic name reference to GptChannelConfiguration			
Post-Build Variant Multiplicity	false			
Post-Build Variant Value	false			
Multiplicity Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time	_		

Value Configuration Class	Pre-compile time	Х	All Variants
	Link time	_	
	Post-build time	_	
Scope / Dependency	scope: local		
	dependency: DltGeneralTimeStampSupport is set to TRUE and DltGeneralStbMTime BaseRef is not configured.		

1

[ECUC_DIt_00845] Definition of EcucReferenceDef DltGeneralNvRamRef

Parameter Name	DltGeneralNvRamRef			
Parent Container	DltGeneral			
Description	If the Dlt module shall be able to store modified parameters during runtime persistently, this reference shall be set and shall point to the NvmBlock.			
Multiplicity	01			
Туре	Symbolic name reference to NvMB	Symbolic name reference to NvMBlockDescriptor		
Post-Build Variant Multiplicity	false			
Post-Build Variant Value	false			
Multiplicity Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time	_		
Value Configuration Class	Pre-compile time X All Variants			
	Link time –			
	Post-build time	_		
Scope / Dependency	scope: local			

$[{\tt ECUC_DIt_00914}] \ {\tt Definition} \ of \ {\tt EcucReferenceDef} \ {\tt DltGeneralStbMTimeBaseRef}$

Parameter Name	DltGeneralStbMTimeBaseRef		
Parent Container	DltGeneral		
Description	If TimeStampSupport is used the Dlt module shall fetch the time from the StbM module by calling StbM_GetCurrentTime with the here referenced StbMSynchronizedTime Base.		
Multiplicity	01		
Туре	Symbolic name reference to StbMSynchronizedTimeBase		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time X All Variants		
	Link time –		
	Post-build time –		
Value Configuration Class	Pre-compile time X All Variants		
	Link time –

10.1.3 DItSwc

[ECUC_DIt_00856] Definition of EcucParamConfContainerDef DItSwc \lceil

Container Name	DitSwc		
Parent Container	Dit		
Description	Contains necessary configuration parameters of the AUTOSAR Dlt module to interact with SWCs.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time X VARIANT-LINK-TIME		
	Post-build time X VARIANT-POST-BUILD		
Configuration Parameters			

Included Parameters			
Parameter Name	Multiplicity	ECUC ID	
DltSwcSessionId	1	[ECUC_Dit_00852]	
DltSwcSupportLogLevelAndTraceStatusChange Notification	1	[ECUC_Dit_00853]	
MaxSwcLogMessageLength	1	[ECUC_Dlt_00909]	
MaxSwcTraceMessageLength	1	[ECUC_Dit_00910]	

Included Containers			
Container Name	Multiplicity	Scope / Dependency	
DltSwcContext	0*	This container contains the configuration of ApplicationId / ContextId pairs which are supported by this SWC.	

[ECUC_DIt_00852] Definition of EcucIntegerParamDef DItSwcSessionId [

Parameter Name	DltSwcSessionId			
Parent Container	DltSwc	DltSwc		
Description	An ECU wide unique ID to identify the	ne port a	SWC (instance) uses.	
Multiplicity	1			
Туре	EcucIntegerParamDef			
Range	0 18446744073709551615			
Default value	-			
Post-Build Variant Value	false

	Link time X VARIANT-LINK-TIME, VARIANT-POST-BUILD			
	Post-build time –			
Scope / Dependency	scope: local			

Ī

[ECUC_Dlt_00853] Definition of EcucBooleanParamDef DltSwcSupportLogLevel AndTraceStatusChangeNotification \lceil

Parameter Name	DltSwcSupportLogLevelAndTraceStatusChangeNotification			
Parent Container	DltSwc	DitSwc		
Description	Flag indicating, whether Dlt has to provide a R-Port for the notification of the SWC about LogLevel or TraceStatus changes.			
Multiplicity	1	1		
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPILE	
	Link time X VARIANT-LINK-TIME, VARIANT-POST-BUILD			
	Post-build time –			
Scope / Dependency	scope: local			

1

[ECUC_DIt_00909] Definition of EcucIntegerParamDef MaxSwcLogMessage Length \lceil

Parameter Name	MaxSwcLogMessageLength			
Parent Container	DltSwc	DltSwc		
Description	Defines the maximum allowed length (uint16) for LogMessages. The upper limit for the range of this parameter is currently defined by the range of the data type. The actual upper limit for the range of this parameter is identical to the maximum length of all configured Dlt log or trace messages, which is known when all log or trace messages are configured.			
Multiplicity	1			
Туре	EcucIntegerParamDef	EcucIntegerParamDef		
Range	8 65535			
Default value	-			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time	Х	VARIANT-LINK-TIME, VARIANT-POST-BUILD	
	Post-build time	_		
Scope / Dependency	scope: local			

[ECUC_DIt_00910] Definition of EcucIntegerParamDef MaxSwcTraceMessage Length \lceil

Parameter Name	MaxSwcTraceMessageLength			
Parent Container	DltSwc	DltSwc		
Description	Defines the maximum allowed length (uint16) for TraceMessages. The upper limit for the range of this parameter is currently defined by the range of the data type. The actual upper limit for the range of this parameter is identical to the maximum length of all configured Dlt log or trace messages, which is known when all log or trace messages are configured.			
Multiplicity	1

10.1.5 DltConfigSet

[ECUC_DIt_00842] Definition of EcucParamConfContainerDef DItConfigSet \lceil

Container Name	DltConfigSet
Parent Container	Dit
Description	This container lists all the global Dlt functionalities that can be enabled or disabled at pre-compile time to optimize resource consumption.
Configuration Parameters	

No Included Parameters

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DltLogLevelSetting	1	Contains settings for thresholds.
DltLogOutput	1	Contains settings for log/trace message output
DltProtocol	1	Configuration parameters for handling the specific protocol variants.
DltRxPdu	0*	Contains the Pdu IDs to be used for Dlt control messages reception.
DltTraceStatusSetting	1	Contains settings for trace status

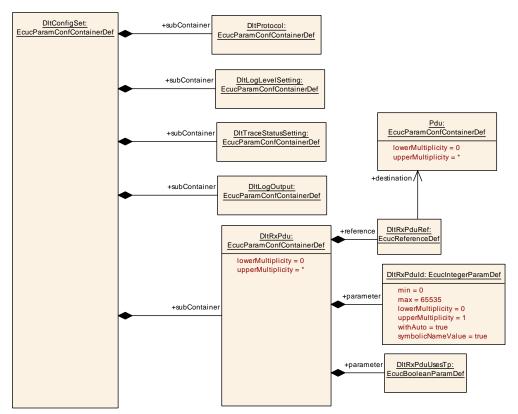

Figure 10.4: DltConfigSet

10.1.6 DItProtocol

[ECUC_DIt_00832] Definition of EcucParamConfContainerDef DltProtocol

Container Name	DitProtocol
Parent Container	DltConfigSet
Description	Configuration parameters for handling the specific protocol variants.
Configuration Parameters	

Included Parameters			
Parameter Name	Multiplicity	ECUC ID	
DitHeaderUseEculd	1	[ECUC_Dlt_00811]	
DltHeaderUseSessionID	1	[ECUC_Dlt_00813]	
DltHeaderUseTimestamp	1	[ECUC_Dlt_00814]	
DltUseExtHeaderInNonVerbMode	1	[ECUC_Dlt_00812]	
DltUseVerboseMode	1	[ECUC_Dlt_00911]	

Included Containers		
Container Name	Multiplicity	Scope / Dependency
DitEculd	1	This is a choice container to choose between a Eculd value or a callout to get the Eculd.

1

[ECUC_DIt_00811] Definition of EcucBooleanParamDef DltHeaderUseEculd [

Parameter Name	DltHeaderUseEculd		
Parent Container	DltProtocol		
Description	Corresponds to field WEID (With ECU ID). If set ECU ID shall be placed in the header, else not. If DltGeneralNvRAMSupport is enabled the value of the parameter defined here is also the initial value for the corresponding NvRam entry. If DltGeneralNv RAMSupport is not set, Link-Time or Post-Build configuration shall be used.

10.2 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

Additional module-specific published parameters are listed below if applicable.

A Mentioned Class Tables

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document but which are not contained directly in the scope of describing specific meta-model semantics.

Aggregated by	AtpClassifier.atpFeature, SwComponentType.port				
Attribute	Туре	Mult.	Kind	Note	
mayBe Unconnected	Boolean	01	attr	If set to true, this attribute indicates that the enclosing RPortPrototype may be left unconnected and that this aspect has explicitly been considered in the software-component's design.	
required Interface	PortInterface	01	tref	The interface that this port requires. Stereotypes: isOfType	

Table A.2: RPortPrototype

Class	Referrable (abstract)		
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable		
Note	Instances of this class can be referred to by their identifier (while adhering to namespace borders).		
Base	ARObject		
Subclasses	AtpDefinition, BswDistinguishedPartition, BswModuleCallPoint, BswModuleClientServerEntry, Bsw VariableAccess, CouplingPortTrafficClassAssignment, DiagnosticEnvModeElement, EthernetPriority Regeneration, ExclusiveAreaNestingOrder, HwDescriptionEntity, ImplementationProps, LinSlaveConfig Ident, ModeTransition, MultilanguageReferrable, PncMappingIdent, SingleLanguageReferrable, SoConl Pduldentifier, SocketConnectionBundle, TimeSyncServerConfiguration, TpConnectionIdent		
Attribute	Type Mult. Kind Note		

Class	Referrable (abstract)			
shortName	Identifier	1	attr	This specifies an identifying shortName for the object. It needs to be unique within its context and is intended for humans but even more for technical reference.
				Stereotypes: atpldentityContributor Tags: xml.enforceMinMultiplicity=true xml.sequenceOffset=-100
shortName Fragment	ShortNameFragment	*	aggr	This specifies how the Referrable.shortName is composed of several shortNameFragments.
				Tags: xml.sequenceOffset=-90

Table A.3: Referrable

B Change History

Please note that the lists in this chapter also include constraints and specification items that have been removed from the specification in a later version. These specification items do not appear as hyperlinks in the document.

B.1 Change History of this document according to AUTOSAR Release R23-11

B.1.1 Added Specification Items in R23-11
